I notice in your issue of May 21st an article by Mr. W. H. Dammond, of Nottingham, with reference to "cab signalling." He still calls the Railophone a "toy," and adds that it is a "very frivolous waste of time" to test a toy.

Mr. Dammond raminds me of a child whose toy is always better Mr. Dammond reminds me of a child whose toy is always better than anybody else's, and who never gives credit to the work involved in designing toys. He condemns the Railophone without knowing anything about it, and judges in a very autocratic manner what is right and what is wrong. After he has run everything down in a wholesale fashion, he thinks it fitting to ask Mr. Acfield to explain some important details of the Railophone. Then, before finishing his illogical outburst, he groups the wireless inductive (Faradic) system of the Railophone with the radio-active (Hertzian) wave system, and declares them both "decidedly wrong." I do not think he would know the real difference between these two swatems and so he comes to the following conclusion:—"The systems, and so he comes to the following conclusion :- "The

wireless impulse tries as hard to go to the wrong locomotive as it does to go to the right one, but the same is not true with the ramp system.

system."

I agree with him as far as a purely wireless or Hertzian system and his ramp are concerned, especially when a ramp is bodily torn up by a passing train, as happened last year, when the ramp made no attempt to go to a wrong train.

I do, however, not at all agree with him about his argument, viz., that the same happens with the Railophone. First of all, the Railophone is a true positive safety system and the ramp is the reverse. Secondly, with the Railophone, continuous control of the trains is assured and a positive clear signal is obtained on the train. reverse. Secondly, with the Railophone, continuous control of the trains is assured and a positive clear signal is obtained on the train, which, by the arrangement of the primary circuit, is converted into a positive dauger signal. Those who have studied the inductive researches and tests I have carried out, and all those who are conversant with the laws of induction, know that the governing factor of a Railophone plant is the "mutual" induction between the two circuits. Such mutual induction depends on the dispositions and dimensions of the primary or stationary circuit, both being of a rectangular shape and parallel. Now in the calculation of a mutual inductance, the net inductive force creating a current in the secondary depends on the logarithmic value of the respective distances between the limbs of the primary and the secondary distances between the limbs of the primary and the secondary circuits.

Such value in a Railophone plant of correct design is the log10 2, so that we can write:

 $\mathbf{m} = k \times \log_{10} 2$ 

for the safety zoner, and :--

 $\mathbf{m} = k \times \log_{10} 1$ 

for the danger zones.

s As  $\log_{10} 1 = 0$ , we have proof of the soundness of a Railophonic induction plant.

I may mention for the information of your readers, that with a Railophone plant the value for the constant k is approximately

A, I believe, I have previously promised you to furnish the technical Press with all the details of my research work, now extending over five years, I shall be pleased to give your readers full particulars and diagrams, as soon as time and circumstances permit,

and if the railway companies desire me to do so.

In the meantime, I am glad to have succeeded in amusing Mr.

Dammond with the "Toy on the Midland."

H. V. Kramer.

Eighsston, May 25th, 1915.

About a year ago I was in a signal-box at a place near Orleans, where a wreck like the one at Gretna cannot occur; but, of course, such dangerous and primitive makeshifts as lever collars are not

relied upon for safety there.

Elsewhere in France and at thousands of places in the United States and Canada I have seen at work what I saw near Orleans, viz., electrical apparatus which yields a far higher degree of safety than can possibly be attained by such a crude mechanical device as

a lever collar.

If a signalman is to blame for not making the prescribed use of device that no railway ought to be allowed to employ, then the Board of Trade is even more culpable for sanctioning the employment of such a death-dealing anachronism. One engineering expert has rightly said: "The lever collar is merely a patch on the signalling system." He would have been justified in adding that it is a patch which obsoures the dangers of, but does not mend, a

it is a patch which obscures the dangers of, but does not mend, a system that is thoroughly bad.

The assertion that "it will be a long time before the signalman can be replaced, even to a limited extent" is one that ceased to be true at least a quarter of a century ago. On more than 25,000 miles of steam railway track, the signalman has been completely replaced in the matter of guarding against wrecks like that at Gretna; and on more than 10 per cent of this mileage his elimination from this matter was effected as long as 10 years ago. Electrical equipment has relieved the signalman of cares which cannot safely or justly devolve upon the "human element"; and, as a result, the signalman has, in these cases, been free to concentrate his attention on those responsibilities with which he can legitimately be charged. On all this vast mileage, the extinction of mately be charged. On all this wast mileage, the extinction of wrecks of the Gretna species has synchronised with this "replacing" of the signalman.

Every mile of English high-speed express routes ought to have been track-circuited at least 10 years ago. That this has not been done is a matter for which the Board of Trade deserves the severest wind of condemnation. One does not need to go farther back than Colchester to find a Board of Trade Inspector actually sanctioning the employment of lever collars. If the Board's inspectors had, during all these years, been performing their duty of making proper preventive recommendations and of condemning dangerous signalling mathods it is guite contain that such primiting and signalling methods, it is quite certain that such primitive and clumsy death-traps as lever collars, release keys for block instruments, and the rotary lock-and-block, would have disappeared from British railways, and that electrical methods of proved efficiency

British railways, and that electrical methods of proved efficiency would be universal thereon. In that case the worst collision in British history would have been prevented.

During the last six years fatal wrecks of the Gretna class have been second in number only to those of the Aigill species. The existence of a preventive for wrecks of each kind has been well known, for 30 years as to the former and for four years as to the latter kind, both preventives being electrical. These expedients are the track circuit for the Gretna class, and visual and audible

three-indication cab signals of the ramp type for the Aisgill class. In the last six years the Board of Trade Inspectors have occasionally made proper preventive recommendations as to the former, but have not once done so regarding the latter class of fatal railway

Wm. H. Dammond.

Nottingham, May 30th, 1915.

### Karachi (India) Tramways (Petrol).

With regard to the reference made in a recent issue of the ELECTRICAL REVIEW to the Karachi tramway extensions, I should like to point out that the Karachi tramways, which belong to my company, though serving a population of over 140,000, are not an "electric" undertaking, but are entirely operated by "Simplex" self-contained petrol cars.

The extensions now under construction are to provide a tramway service to the new Gos-Portuguese settlements known as Gindinatus
Town, and will be worked by self-propelled cars similar to those on
the other parts of our system. In fact, were it not for this economic type of traction requiring but a small capital outlay compared with electric installations, it would not have been possible for the com-pany to have entertained these extensions, going, as they do, to a sparsely-populated, but growing, district.

Geo. Gale,

Secretary, East India Tramways Co., Ltd

London, E.C., May 29th, 1915.

### LEGAL.

### MERCHANDISE MARKS ACT PROSECUTION.

AT the Manaion House Police Court, on the 27th ult, the British Thomson Huston Co., Ltd., of Mszla House, E.C., were summoned before Ald, Sir John Kuill, for unlawfully applying and selling an electrophone to which a false trade description had been applied, in contravention of the Merchandise Marks Act, 1887. Mr. J. Hunter Gray appeared for the company, who pleaded not guilty to

MR. BODKIN, who prosecuted, said the proceedings were at the instance of a Mr. Hammer, the owner of certain patents and registered designs in connection with electrophones, a contrivance which by the aid of an electric battery would help deaf people to hear. Mr. Hammer, counsel went on to say, was connected in 1912 hear. Mr. Hammer, counsel went on to say, was connected in 1912 and 1913 with a London company for representing an American company called the Stolz Electrophone Co., of Chicago, and being connected with that company and the owner of patents, an arrangement was come to between that company and the British Thomson-Houston Co., Ltd., to manufacture electrophones according to a description of patent of which Mr. Hammer was the owner. After much correspondence, an order was placed with the British Thomson-Houston Co. to manufacture a large number of electrophones for the Stols London company the former company electrophones for the Stolz London company, the former company electrophones for the Stols London company, the former company taking a collateral guarantee for payment. Four thousand electrophones were to be manufactured. A sample instrument was submitted for the approval of the patentee, and the order was to be executed according to this model, by the defendant company. For the purpose of turning out these instruments a large quantity of tools of a special kind had to be made by the defendants. From the correspondence it appeared, said Mr. Bodkin, that the goods were not to be manufactured at the company's works at Rugby, but were to be made in Barlin. the company's works at Rugby, but were to be made in Berlin.

MR. GRAY: I object to this. The company never had works at

MR. BODKIN: I am only speaking from my instructions, and I have here a letter in which occurs the sentence, "We will write from our Berlin factory, &c."

MR. GRAY: That is wrong. We have no Berlin factory. I have

not seen that letter.

MB. BODKIN: This is only one of several letters which confirm the same thing. In the correspondence, Mr. Bodkin said, a question was raised as to how these goods, manufactured, as it was understood, in Berlin, ought to be marked in order to comply with the Merchandise Marks Act, for there would be a breach of that statute if they were marked "Made in London," when in fact statute if they were marked "Made in London," when in fact they were manufactured abroad. In order to conform to the law, the words "Made in Germany" were stamped upon the completed articles supplied by the defendant company. These instruments embodied certain designs as well as patents, and it was necessary, in order to preserve the rights of the owner of the designs, to stamp the articles with a registered number. With regard to the 4,000 order the Stolz London company went into liquidation, and the guarantee for the payment to the defendant company for the instruments by Mr. Holt became worthless. The result was that the defendants having manufactured a good number of these electrophones, stamped "Made in Germany," they had them on their hands unpaid for. The reason Germany," they had them on their hands unpaid for. The reason payment was not made, which Mr. Hammer gave, was that the articles, between 150 and 200 of the first consignment sent, were not in accordance with the Merchandise Marks Act as regarded the mark applied to them. Mr. Bodkin, in explanation, produced an electrophone in Court for the inspection of the magistrate On the top of the transmitter, he pointed out, there was a sort metal loop, adapted to hook on to the cost of a person using the instrument. This was screwed to the back of the instrument t

prevent any meddling and putting the instrument out of gear. It was contended on the part of the prosecution that, as this metal hook covered up the words "Made in Germany," this article was not marked in accordance with the Act. This covering up of hook covered up the words "Made in Germany," this article was not marked in accordance with the Act. This covering up of the words mentioned was the reason for the refusal to pay for goods manufactured in this way. On the back of the instrument there was a line which read, "Begistered design, No.—," but, said Mr. Bodkin, the instrument could not be possibly defined, because the registered number had been deliberately defaced; while on those goods supplied by the defendants on which the words "Made in Germany" were concealed, the registered number was plainly visible. The Stolz London company having gone into liquidation, and the order for the manufacture of these instruments having come to an end, Mc. Hammer eventually discovered that the defendants were selling Mr. Hammer eventually discovered that the defendants were selling electrophones of the British Thomson-Houston Co., and for the purpose of ascertaining what sort of instrument it was that they were selling, Mr. Peters, clerk in the office of the solicitors prosecuting, purchased one. On the front the name Stolz was omitted; on the back a metal hook covered up the words "Made in Germany," and the number had been defaced. Upon examination, Mr. Hammer found that the instrument was an exactly similar thing to his own patent, and accordingly the present proceedings were brought. In November last defendant company sent out acircular, headed "The British Thomson-Houston Electrophone," and represented to the public that they had produced a reliable instrument with all the latest improvements embodied in it. It did not convey, said Mr. Bodkin, that these goods were the subject of another person's patent. It was suggested that this company, in order not to suffer a bad debt, had adopted this registered design and patent as their own, and had advertised the sale of the instrument, as if they were the owners of it. On no part of the instru-ment purchased appeared the description British-Thomson Houston Co., as the manufacturers, but there was the name on the original goods, and also a serial number indicating that they were the manufacturers. This, however, was obliterated in respect of the goods the defendants were advertising for sale. Evidence was called in support of the summons, and the further hearing was adjourned.

### INSTITUTION OF ELECTRICAL ENGINEERS.

THE annual general meeting was held on Thursday last week. The President, Sir John Snell, referring to the result of the ballot for members of Council, expressed a wish that the members the m-selves would nominate candidates in addition to the names suggested by the Council, so that that body should be made as thoroughly representative as possible. In counce im with the work done for the War Office in selecting men for commissions in the Army, he stated that not one of the nominations the Institution had made had been tract not one of the nominations the institution had made had obenturned down; and some of the officers had already received promotion. The President drew attention to the paragraph in the Report which related to the formation of a special Committee, and remarking that the Council had been criticised for its inability to take effective action in industrial matters, he pointed out that the British Electrical and Allied Manufacturers' Association had been consulted, and fully concurred in the decision arrived at, that nothing could be done to foster British trade during the war; things would solve themselves in due course. In the matter of the duration of loans for engineering works, the President was associated with the Presidents of the Institutions of Civil and Mechanical Engineers in making representations to the Local Comment Read. He made a strong appeal to the members to Government Board. He made a strong appeal to the members to support their Benevolent Fund, on which calls were certain to be made as the outcome of the war.

On the motion that the Report be adopted, MR. LL. B. ATKINSON asked that the names of members of I.E.E. Committees should be published, and suggested that the Benevolent Fund, which was quite unworthy of that Institution, had not been brought before the notice of the members as it should have been.

MR. W. M. MORDEY said that the contributions to the Fundamounted to an average of only 61. a member; it was urgently necessary that the fund should be increased, and he thought that large numbers of small contributions were especially desirable. Mr. Rawlings agreed, suggesting a maximum of 5e, and Mr. Raphael proposed that a large committee should be formed, to invite contributions from friends and from manufacturing firms.

Replying to these and other points that were reised, the President said they would receive c reful consideration. The reduction of membership was partly due to the examinations, but the class of candidate that was coming forward was distinctly higher than formerly. Part of the reduction was the result of the thin formerly. Part of the reduction was the result of the troubled times they were pessing through.

Introducing the Statement of Accounts, the hon. treasurer, Mr.

Robt. Hammond, said that with the reduced membership they had to record a reduced net income—£1,200 less than last year: but the latter was an abnormal year. The assets at cost were £114,929, and their liabilities £43,359, leaving a margin of £71,569, which

showed an improvement of £2,046.

The Report and Accounts were adopted nem con, and the usual votes of thanks to the hon. solicitors and the hon, suditors were

The ballot for five "ordinary m mbers of Council" resulted in the clim of Prof. T. Mather and Messrs. W. A. Chamen, H. Die'i s.n, H. F. Prec'or and G. S. Rom. The remaining vacancies were filed as shown in the ELECTRICAL REVIEW, of Ap i 2nd,

# THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872. TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

## OFFICE 1-4, LUDBATE HILL, LONDON, E.O.

Telegraphic Address: "AGERRAY, LONDON." Code, A B C. Telephone Nos.: Holborn 988; Central 4425 (Editorial only). The "Electrical Review" is the recognised medium of the Electrical Trades and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates. — Per annum, postage inclusive, in Great Britain, 49s. 6d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

### INCREASING THE OUTPUT.

For more than 20 years past the pages of our own and other journals concerned with engineering industry have published criticisms of the disposition of Labour Organised Labour blatantly claimed to limit output. the right to say how many hours' work a man should do in a day, to define when and where a particular class of worker should end his operations and another class begin, and to limit the efficiency of the individual worker and the capacity of the equipment with which he did his work. Employers fought such tendencies again and again and were attacked because they were Capitalists. That there were rights and wrongs on both sides we never failed to acknowledge, but we have unhesitatingly and consistently tried to show that the restrictive and limiting tendency was harmful to both Capital and Labour, and was altogether opposed to the best interest of British engineering industry.

At the time of the engineering strike of 1897 it was stated that funds which were raised to assist strikers and their families in their fight against British industrial leaders included subscriptions from Germany, whose manufacturers received contracts purely because closed English factories were unable to handle them. We have no desire at this date to set muddy water in motion, but we cannot help remembering such incidents when we observe the tendency that has been so often and so loudly denounced as hampering our great industries, singled out for attack by the Minister of Munitions, because in the present time of crisis it is imperative that we secure the maximum output of everything that is essential for the successful conduct Mr. Lloyd George addressing Manchester engineers last week said that Labour must be directed and controlled by the State to that one vital end. He showed that regulations, customs, and practices imposed by Unions in times of peace were utterly inapplicable and out of place in the terrible urgency of war. Objections to working more than so many hours per day, because "my Trade Union won't allow it"; or to increasing output because "my Trade Union won't allow me to do more than my share"; or the refusal to work beside an untrained man because it is "against my Union's regulations"—objections which have hampered national industry for years -are not to be permitted to stand in the way in these days. The Minister of Munitions and the Coalition Government may have to use their powers under the Defence of the Realm Act if men are blind to the interests of the Empire, or are not prepared to meet willingly their obligations to those who are holding the seas or fighting in one of the many battlefields on which bloody slaughter is proceeding in combat with "the most formidable antagonist that ever attacked human liberties."

At the end of Mr. Lloyd George's speech, representatives of the Manchester Engineering Employers' Federation and of the Amalgamated Society of Engineers, declared the readiness of Lancashire engineering employers and Trade Unions alike to support in every possible way the great national effort to increase the production of war material. It seems inconceivable that when the issues involved are such as to make even the man in the street exclaim: "Victory or Death!" there should be any holding back of effort in the factory.

The fight has to be a fight to the finish, or we may lose all that we cherish or hold dear, all the freedom and honour and liberty that our fathers have struggled and fought for. But in order to render that freedom and liberty inviolable for the generations that follow, surely both masters and men will see the necessity for obedience to those who as our national leaders are striving so to organise our works and our labour that there may be no doubt about the ultimate issue.

Mr. Lloyd George said that if he could for a moment make everybody realise the great issues, and grasp the great dangers of the struggle in which we are engaged, there would be but one cry from every home to the Government:— "Convince yourself as to what action is necessary; take it boldly, and we will see you through."

In our old Labour controversies we heard and said much about "Common Interests." Here, if never before, we have "common interests" at stake, and a recognition of that serious truth peremptorily demands universal wholehearted, self-sacrificing, co-operation.

Electricity in Farming.

ELSEWHERE in this issue we publish a short account of the steps which have been taken to supply farmers on the outskirts of the city of Hereford with electric light and power; this is the continuation of a general article on the subject of "Electricity in Farming," which commenced in our last issue.

Living for the most part remote from the electrically-developed town areas, and beyond those influences which tend to keep the town-dweller on the alert for something new, there is probably no class of our population less familiar with the economic value of electricity than the farmer class, and yet all the available evidence goes to show that when once he has made the plunge, the farmer, whether in this country or abroad, becomes an enthusiastic user of electricity for both power and lighting, and, incidentally, a consumer of much greater value than the average consumer in any town, unless it be an industrial centre.

Unfortunately, this is not generally appreciated by our central-station engineers—on whom the task of influencing the farmer in things electrical must devolve—and there is therefore every chance of this valuable field for electrical development being neglected, unless those most concerned can be led to interest themselves in the subject.

The results obtained by Mr. Kerr at Hereford are so striking, and present such an object lesson to other central-station engineers within reach of the farming community, that they cannot be ignored by the latter; especially is this the case with the small undertaking, whose rate of progress has been mainly dependent on the almost microscopical growth of a country town.

In the Hereford area the average farm consumer is worth £20 per annum to the electricity department, while the average revenue per consumer from all consumers is between £8 and £9, a figure which probably represents a good average for a non-industrial community of 20-25,000 inhabitants. If a profit can be shown on the latter, it seems obvious that the farm consumer, who can be reached with overhead lines costing about £110 per mile, is a most attractive proposition to the supply engineer.

We have emphasised elsewhere the necessity of showing the farmer the real thing—nothing can take the place of a practical demonstration—and given a good prospective farming area, it would no doubt save time and trouble to come to some agreement with one farmer for the use of his farm for demonstration purposes for a year, possibly in return for a free supply of energy during that period.

This would enable the engineer to test the feeling of his immediate neighbourhood, and to obtain valuable data as to the probable nature of the load, and, no doubt, would assist him in formulating an efficient scheme of supply to commence with.

But this is a digression; the prime necessity of the moment is to bring home to our supply engineers and agriculturalists the mutual advantages of introducing electrical methods on the farm.

There are in the British Isles over 45 million acres of land under cultivation, giving employment to a bigger percentage of the population than any other industry: surely it cannot for a moment be contended that this important section of our national economy is beyond the pale in matters electrical.

With the experience gained under the varied conditions obtaining in half-a-dozen European countries, some of them intensively cultivated, and in the sparsely populated districts of Canada and the States, favourable to the development of electrical methods on the farm, there is every incentive for us seriously to grapple with the problem, which so directly concerns both the electric supply and manufacturing interests of this country.

WE have had occasion more than once Responsibilities to advert to the responsibilities which attach to the position of director of a limited company. It is not for nothing that a man allows his name to appear on a prospectus. He is generally paid fees or he acquires certain other advantages for so doing; but it cannot be made too plain that his name is not put on a prospectus for amusement. The law is thus stated in Lord Halsbury's "Laws of England," Vol. V, p. 366: "Directors may incur liability to persons who subscribe for the company's shares or debentures in reliance upon a prospectus which contains material misrepresentations of but "a director is not liable for untrue representations made to the shareholders if he honestly believes the representations to be true, and has reasonable grounds for his belief. Thus, where a company is formed to take over an existing business which turns out to be ruinous, the directors will not be responsible for making the purchase unless the ruinous nature of the business is obvious on the same principle that protects an agent purchasing by authority of his principal." The liability of directors is well illustrated by a case recently decided in the Court of Appeal—Adams v Thrift and Others. The defendants were directors of the St z Electrophone Co. (1913), Ltd., a company formed (according to the prospectus) "to take over (inter alia) as a going concern the business of the Stolz Electrophone Co. (London), Ltd., and the old-established business of the Homer Earphone Co., of New The prospectus stated that the business of the American company had been of a highly remunerative character; that the turnover had increased from £11,923 9s. 5d. in 1910 to £32,615 13s. 3d. in 1913, and that the London company were operating 175 branches and agencies in various parts of the world. It was alleged by the statement of claim, and found as a fact by Mr. Justice Eve, that there was no such company as the Homer Earphone Co. in existence. The learned Judge found that although the defendants personally believed that the statements in the prospectus were true they had no reasonable ground for the belief. One of these directors appealed. As regarded him the Judge had found that, although he knew that the electrophone was not a mere quack affair, and though he had the prospectus signed by three colleagues, this did not afford him a reasonable ground for relief. In giving judgment dismissing the appeal, the Master of the Rolls pointed out that the appellant director "did not ask from any human being information about the particular statements which had been proved to be untrue. He said that the promoter had told him that it was all right. The promoter was the last person in the world whose uncorroborated statement ought

to be relied on by an intending director as a justification for

his belief in statements in a prospectus."

From the rarity of the reports of cases of this kind in recent years, it may be presumed that as a rule directors are more cautious than they used to be; but it is manifest that if the directors in the case above mentioned had made the most perfunctory inquiry they would probably have found that the company in question did not exist.

THERE has been a strong and sustained upward movement in the copper market since last writing, and the ultimate limits of the rise have hardly yet been attained, for the demand reported by producers and dealers continues to expand in an alarming fashion, and it is doubtful whether the full increase in production now in progress in America will do more than afford modified relief to the situation. The statistical position is, of course, a matter of considerable anxiety. There is every belief felt that the stocks in the United States have dwindled down to bed-rock figures, but there are no details available. On the other hand, the last European statistics were not good, the stocks of standard copper having increased 5,000 tons during the month, the total stocks in England and France by over 4,000 tons, and the European visible supply by about 2,600 tons during May. This, however, had no damping effect upon sentiment, which, indeed, improves steadily under the rising tendency of the share markets in the United States, accompanied by a large buying on account of the enormous orders for munitions which continue to be placed. There is not the least chance of any cutting down of the war demand on the part of the Allied Governments for many months at the very least, and, indeed, there is talk in America of munition orders being booked All this tends to check any enthusiasm into 1917-18. which might otherwise be felt regarding the termination of hostilities, but it implies at the same time a huge destructive consumption of copper. Whether the world's mines can turn out sufficient material to satisfy the demands of the Allies is becoming open to doubt, while the fact that there are possibilities of serious friction between America and Germany, has induced the United States Government to assume a much more interested air regarding her supplies of munitions.

If the United States comes in as a buyer of copper on anything like the scale necessary to play any part of importance in a world-wide conflict, copper prices must inevitably advance further, and by leaps and bounds. There is not the least doubt that the United States domestic demands have undergone a very wide expansion, which may be only the forerunner of still greater calls made upon her reserves There has been much more speculative and resources. interest in the London market, a good proportion of which has emanated from America, and there should be no illusion as to the strength of the position in which producers now find themselves. They are sold very far ahead, and are in an entirely independent position. A distinct feature is the enormous premium which Lake Superior copper demands over electrolytic, and which arises from the fact that the Allied Governments are, in many cases, insisting upon the use of the former. It is doubtful whether any good purpose is served by this rigid adhesion to time-honoured pre-Other nations can get along well enough with electrolytic, but in some matters ultra-conservatism is still worshipped here as a fetish. Meanwhile all indications appear to point to a steadily higher level of values, though no doubt with fluctuations in the standard market.

Copper Wire
Manufacturers
and the
Contraband
Problem.

In view of the satisfactory inquiries for copper goods, particularly for copper wire for electrical purposes, being daily received by British manufacturers from Germany's chief European markets in Holland, Sweden, Spain, &c., it is becoming a matter

for complaint with manufacturers in this country that there are unnecessary precautions and protracted delays for which

the War Trade Department of the Board of Trade is responsible. As every manufacturer of contraband goods is aware, the sanction of the War Trade officials has to be obtained before shipment can be made to most, if not all, of the neutral countries adjacent to the German Empire, Austria, &c., and while all business men have long since realised the necessity for some strict supervision from the proper source in preventing war material of any form from entering the territory of our enemies, many are of the opinion that the tedious and circumlocutory manner in which the War Trade officials have been dealing with the subject is unwarrantable, and as restrictive to legitimate trading as it is absurd in theory. The procedures that have to be gone through by manufacturers before sanction for shipment is obtained are thought to be, as a rule, most unnecessary.

Instances have been mentioned where delays of as long as six weeks and two months have occurred before sanction has been obtained to ship goods to countries like Spain and Sweden, and this only after having passed through procedures involving several communications with the War Trade authorities, application for references from the Minister for Foreign Affairs, sworn declaration from the consumer before a notary and legalised by the British Consul, further communications with the Customs authorities in England, and other formalities necessitating loss of valuable time and money.

Men Who Stay at Home. While we have every sympathy with the movement' which aims at getting increased efficiency as a consequence of reorganisation and industrial mobilisation, there is a danger that the enthusiasm of the newspaper Press in this connection may have some other consequences which are not so desirable. We must not forget that it has been laid down for us that our forces have to be mobilised for three purposes:—

(1) Military or naval service; (2) the production of munitions of war, directly and indirectly; (3) the mainten-

ance of our export trade.

We are just a little afraid that in discussing (1) and (2), which are undoubtedly the more immediate necessities the situation, there is a disposition with those who give little thought to the industrial and financial phases of the matter, to consider the third of the foregoing purposes as being of practically no importance. Now whatever our age or fitness, we are all more or less engaged in heart-searching, trying to discover what we can individually do to help bring the war to a conclusion -and quite right too! But there can be no question that for maintaining even our present reduced flow of exports, which on national financial grounds is shown to be so indispensable, we shall require at home many men who, because they are engaged in mere trade matters and apparently not helping in the conduct of the war, are restless and discontented and unhappy, wondering whether they ought not to throw up what they are engaged upon and dothat vague something which they cannot discover. If the present movement organises essential forces and influences lusty youths and factory workers to "play the game" and "do their bit," it will have achieved its purpose, but let us not overlook the fact that there are hundreds, and perhaps thousands, of works which are not required for making war material, and hundreds of thousands of males and females whose services will not be immediately, and perhaps not at all, directly required for fighting or for war factory service. These can be utilised partly in connection with the maintenance of export manufacturing, but they will require suitable staffs and heads to guide and control them. We trust that before long the Government may be able to give us a more definite leading in this matter.

In the meantime, there must be many among our readers who, while they cannot now adopt the original cry of "Business as Usual," will conscientiously feel that, considered from the point of view of national trade and finance, they must for a good many hours of the working week continue to follow their ordinary industrial and trading avocations though they never handle a rifle or anything that has to do with shells.

### BATTERY-BELL SIGNALLING SYSTEMS IN MINES.

"HOME OFFICE REPORT ON THE DANGER OF IGNITION OF FIRE-DAMP-AIR MIXTURES.

It will be remembered that one of the possible causes of the disastrous explosion at Senghenydd Colliery on October 14th, 1913, put forward at the inquiry, was an electric spark from the signalling wires, and certain tests were made by Dr. Wheeler with the signal bell and battery to prove that a firedamp-air mixture could be ignited. The results of the experiments then made, however, were not conclusive, and Dr. Wheeler has made a further series of experiments at the Home Office experimental station at Eskmeals; his

report on these tests has recently been issued.

In his report on the experiments on signalling apparatus carried out for the purposes of the Senghenydd inquiry, he showed that with three Dania cells giving a current (on closed circuit) of 0.45 ampere under a pressure (on open circuit) of 4.5 volts, it was possible by short-circuiting the current in the signal wires to give a signal to produce a spark which would explode a mixture of air and methane when methane was present to the extent of 8 2 per cent. This was certainly a very disturbing observation, and in view of the fact that a large proportion of the electrical signalling apparatus in use in coal mines is affected by this conclusion, the Secretary of State requested Dr. Wheeler to carry out further experiments with the object of "obtaining a system of bare wire signalling which would be free from the danger of ignition of firedamp-air mixtures by the flash produced on breaking circuit at the signal wires." In his present report Dr. Wheeler says: "This object has been attained, inasmuch as it has been found possible to determine with considerable accuracy the limits of voltage, current and self-inductance of an electric circuit, derived from the primary batteries, that can cause ignition of the most sensitive firedamp-air mixture by the flash obtained on breaking the circuit; and at the same time it has been found possible to construct a bell which, while conforming with the requirements of safety as indicated by these limits, gives an adequate signal."

In the previous experiments made with a bell of the pattern used at Senghenydd Colliery it was found that the most sensitive mixtures contained between 7.3 and 9.4 per cent. of methane, and this conclusion has been confirmed by the present series of experiments, which showed that the most sensitive mixtures contained between 7.5 and 90 per cent. of methane, the amount of current required for ignition of all mixtures lying between these percentages being practically the same, namely, about 0.2 ampere. With mixtures containing less than 7.5 or more than 5) 0 per cent. of methane, the difficulty of ignition rapidly increases, more markedly as the higher limit of inflammability is approached. These limits are 5.6 (lower) and 14.8 (higher) per cent., and the mixture that has methane and oxygen in combining proportions, for complete combustion to form carbon dioxide and steam, contains 9.45 per cent. of methane. In these experiments artificially-prepared pure methane (99.8 per cent. methane) and pure air (containing 20.8 per cent. of oxygen) were used; but as firedamp often contains a considerable proportion of nitrogen, and the air of mines may contain less than 20 per cent. of oxygen, it seemed desirable to determine the ignitability of mixtures of methane and air to which nitrogen had been added. A mixture of oxygen and nitrogen containing 19 per cent. of oxygen was therefore prepared, and a series of determinations was made of the currents required for ignition of various mixtures of methane with this "atmosphere." The voltage of the current and the inductance of the circuit were the same as in the previous experiments, . and the result showed that rather more current (about 0.22) was required—presumably because of the defect of oxygen while the limits of inflammability were 5 8 (lower) and 12 5 per cent. (higher), and the mixture containing methane and oxygen in combining proportions contained 8 65 per cent. of methane.

Provided, therefore, circumstances were to arise whereby a mixture of firedamp and air of these proportions was present during signalling operations, with a current of 0.2 ampere passing, ignition of the gas would take place at the "break" of the circuit; though such circumstances are probably remote, they are very possible, and, consequently, exceedingly dangerous, and it becomes a strict duty of mine owners and managers to remove this danger as far as human agency permits.

The danger is the "break-flash," and the strength or intensity of this depends largely upon the self-induction of the coils forming the bell magnets; in order to determine the effect of such inductance in signalling circuits, "a number of inductances of known magnitudes were made, consisting of coils of silk-covered copper wire wound in layers on cores of wood, so as to be of constant value at all currents. These were introduced into the circuit from a battery of dry cells, and the current at 90, 60, 30, or 15 volts required for ignition of different mixtures of methane and air by the break-flash determined." The results obtained with current at 90 volts were as follows :-

•		Current required for ignition.								
Self-induction of circuit.	6.0 per cent. methane.	70 per cent. methane.	7.5 per cent. methane.	8.0 per cent. methane.

From this "it will be seen that the amount of current required for the ignition of any of the mixtures increases rapidly so soon as the self-induction of the circuit falls below about 0.03 henry. Results of the same order were

obtained with current at 60, 30 and 15 volts."

Dr. Wheeler found that the amount of current in a circuit—as might be expected—was of far greater importance than the voltage as regards the igniting power of the flash produced on breaking the circuit, and especially with highly inductive circuits. Thus, an 8 per cent. methane-air mixture was ignited by the break-flash with a current of from 0.24 to 0.25 ampere, at any voltage between 10 and 30, the self-induction of the circuit being 0.095 henry. The results up to 90 volts were as follows:-

Voltage.	Current required for ignition (8 per cent. mixture).				
10	0.25 ampere				
12.5	0.245 ,,				
15	0.24 ,,				
30	0.24 "				
60	0.22				
90	0.19 "				

At 90 volts, which is well above the arcing pressure, rather less current, it will be noticed, is required for ignition, but, on the other hand, if the current is only 0.18 ampere, "hundreds of break-flashes can be made in the mixture without causing its ignition, whereas with 0.19 ampere ignition occurs at the first break-flash."

Summarising then (a) the most readily ignitable mixtures of methane and air contain between 7.5 and 9 per cent. of methane, and the susceptibility to ignition by sparks of the firedamps of different mines varies with the proportions of nitrogen they contain as an impurity with the methane which is the main constituent; (b) the self-induction of the circuit is of prime importance in determining whether the break-flash can ignite an explosive mixture, and below about 0.03 henry the current required for ignition rapidly increases; and (c) an increase in the voltage from 10 to 30 volts does not materially alter the amount of current required to ignite a particular mixture, while, on the other hand, an increase in the current of 0.01 ampere is often sufficient to determine the ignition of a mixture.

The solution of the problem then is to reduce the self-induction of the magnet coils of the bell so as to render the intensity of the spark harmless in any mixture, and experiments were carried out with signal bells of different types

(To be continued.)

with perfectly satisfactory results.

### WIRELESS CALL DEVICES.

### BY L. B. TURNER, M.A., A.M.I.E.E.

(Abstract of paper read before the Institution of Post Office ELECTRICAL ENGINEERS, LONDON CENTRE).

In submarine telegraphy moderate power is transmitted, and much less, but still moderate, power is received. In telephony the power transmitted is ordinarily a small fraction of a watt, and only about one ten-thousandth of this may be received at the other end. In wireless telegraphy, unhampered by the limitation of input imposed by the microphone, and with a receiver of extraordinary sensitiveness, the ratio between the power received and the power transmitted may reach a degree of smallness quite unapproached in telephony. The following table shows, in a rough illustrative fashion, the orders of magnitude of the power transmitted and received in the several systems named:

Watts Watts

	Watts insmitted.		. R	latio.
Submarine telegraph	1	10-3		10-3
Telephone	10-2	10-6	••••	10-4
Wireless telegraph	10	. 108	•••••	16-13
M				

The primary difficulty in devising an effective wireless-call apparatus is the extreme smallness of the power available; for, obviously, if the device is to be of the fullest service, the

calling range must be as great as the signalling range.

A secondary difficulty is the avoidance of false calls, that is, calls actuated by foreign wireless stations discharging their

ordinary traffic, or by atmospherics.

The problem is, therefore, in the main, to provide apparatus capable of responding noisily to such stimulus as may be got from an antenna fed with about one-hundredth of a microwatt,

but which will not respond to stray disturbances.

Excluding the coherer from consideration, no wireless call apparatus has yet, so far as I am aware, been put into com-

mercial operation.

apparatus has yet, so far as I am aware, been put into commercial operation.

The available energy is so small, that no relay of the make and-break type with solid metallic local-circuit contacts could be constructed to give reliable service. The ingenious jet relay of Dr. A. Orling, already employed in submarine cable telegraphy, could, however, be used. In this instrument a coil is carried by vertical phosphor-bronze suspensions in the field of a powerful magnet, as in an ordinary D'Arsonval galvanometer. A fine quartz fibre, called the deflector, is stretched as a stiff radial arm attached to the coil. Above this fibre is a vertical glass jet, through the fine orifice of which protrudes a second quartz fibre bearing with a light lateral pressure on the horizontal fibre. A fine stream of acidulated water runs through the orifice of the jet and along the vertical quartz fibre. At the end of the vertical fibre, a little below the deflector, the stream either just hits or just misses one of two platinum plates, thereby either making or not making contact between it and an electrode immersed in the column of acid. A very slight motion of the deflector carried by the coil produces a much magnified displacement of the stream of liquid where it passes the electrode. I have seen such an instrument relay hand-speed signals of .37 microampere. The coil had a resistance of 500 ohms, so that this corresponds to a steady-current power of 7 × 10-11 watt.

Of the amplifier type there is a diversity of patterns. Probably the most familiar is Mr. S. G. Brown's telephone amplifier, capable of responding to currents of telephonic frequency.

Another highly sensitive amplifier is that due to Mr. E. S. Heurtley. This device depends on the change of resistance

fier, capable of responding to currents of telephonic frequency. Another highly sensitive amplifier is that due to Mr. E. S. Heurtley. This device depends on the change of resistance produced in hot, thin platinum wire, when it is slightly displaced across the edge of a blast of cold air.

When the amplifier is used for submarine telegraphy, good readable slip may be obtained at slow speed with a deflecting power of 6 × 10-10 watt in the coil. The power in the siphon recorder would then be about 5 × 10-7 watt, giving a multiplication of nearly 1,000.

In all the relays above mentioned the change in the local

In all the relays above mentioned the change in the local current is effected by the displacement of some comparatively massive body. In the kathode-ray amplifier of Von Lieben and Reiss the moving body is molecular, or, rather, corpus-

The kathode-ray amplifier is likely to play a very important rôle in the future. It can deal with the smallest powers, introduces no perceptible distortion, and is available for amplifying fluctuations of any rapidity up to the frequencies used in wireless telegraphy. The Marconi Company have developed a modified form of the Lieben-Reiss amplifier, which plays an important part in their high great recent reserve.

with the exception of the last, the foregoing relays or amplifiers have been D.c. or low frequency instruments, suitable for use after the high-frequency current has been rectified by a crystal or other detector.

Any one of these extra-sensitive relaying instruments might replace the telephone of an ordinary receiver, and so, in conjunction with other instruments, convert signals which would have been a faint buzzing in the telephone into the ringing of a bell. But whereas the listening operator attends only to a message preceded by a certain sequence of dots and dashes,

his call signal, the bell would not exercise this discrimination. It is necessary, therefore, to arrange that a signal of some special character shall be used for calling, and that the device shall respond only to signals of this character. Although much may be effected by the ordinary tuning methods, a call device requires a greater selectivity than can be thus obtained.

A simple form of call signal is a long dash, and the receiver

A simple form of call signal is a long dash, and the receiver may be constructed so that it will respond only to a dash of not less than a certain minimum duration, which would, of course, be chosen longer than any dash likely to be made in transmitting messages. This principle has been utilised in the P.O., and could be applied to any of the quick-acting relays.

The musical-note transmitter, now so widely used, introduces the possibility of a second line of defence against interference, by making use of musical resonance. The antenna and coupled circuits are already tuned to the high frequency, say 10s to 10c periods per second, giving selection by wave-length syntony; and with a musical note the telephone or other apparatus may be tuned to the spark-frequency, say, 200 to 1,000 periods per second, giving selection by note syntony. The Telefunken amplifier is constructed to make use of note syntony. This instrument consists of a bank of microphonic contact relays, each similar in arrangement to the Brown amplifier with granule contacts. But whereas in the Brown amplifier the electro-mechanical connection between the armature and the armature has a natural frequency greatly exceeding the frequency of the currents to be amplified, in the Telefunken amplifier the armatures are relatively loosely related to the energising circuits, and the natural frequency of each armature is mechanically adjusted to be equal to the spark-frequency (500 periods per second). It is claimed that with a bank of three such tuned amplifiers in cascade very great magnification and selection can be obtained.

But whether the transmitter is a musical one or not, it is and selection can be obtained.

But whether the transmitter is a musical one or not, it is

possible to effect a syntony somewhat analogous to note syntony by transmitting dashes at small regular intervals. A scheme-for a distress call device, depending for its selectiveness on this principle, has been suggested by Mr. W. S. Peake in a recent

principle, has been suggested by Mr. W. S. Peake in a recent patent specification.

The essential point of the device is that the vibration of an armature under a succession of impulses is built up gradually, as in all cases of resonance; that is, the effect of successive impulses is cumulative, as it designedly is not in a Brown amplifier, an oscillograph or a telephone used for speech. Peake employs a transmitter sending alternate dashes and spaces at a definite frequency (between 10 and 40 per second), and the armature of the receiver is mechanically tuned to this frequency, as in the Telefunken amplifier. When the amplitude has grown sufficiently, contact is made and a bell rings. The arrangement is mainly of interest in that it provides a probably adequate selectiveness by the use of a quite practicable apparatus which could be added to an existing ordinary station. It embodies nothing new in principle, for the resonance relay is a well-known device; it was used in an attempt to provide a call device on the Preece induction telegraphe connecting the Skerries with the mainland. I think it would fail on the score of insensitiveness.

fail on the score of insensitiveness

fail on the score of insensitiveness.

One further potential wireless call apparatus is the Marcons Company's quite recently developed device for the remote control of fog-signalling apparatus. This constitutes, I think, the nearest approach that has been made to a practical call device which can be left to itself. The result has been achieved by reverting to the coherer, but in a specially reliable, and consequently insensitive, condition. The coherer controls a relay of conventional type, whose local circuit energises the magnetic acting upon a pendulum of balance-wheel form. Dashes are sent at equal intervals (automatically) from the calling station, and at each dash the coherer coheres, the relay tongue flicks over, and an impulse is given to the balance-wheel. The balance wheel has been mechanically tuned to the frequency of the transmitted dashes, which are of the order of two per ance wheel has been mechanically tuned to the frequency of the transmitted dashes, which are of the order of two persecond; its amplitude, therefore, grows under the repeated stimuli, until a fork carried by the wheel dips into mercurycups, and the fog-gun is thereby switched on or off. Apart from malicious interference the selectivity here is as perfect as could be desired, for however strongly an interfering signal affects the coherer, its effect on the balance-wheel is the same. There are various carefully thought-out detail refinements in this apparatus, and tests appear to have shown that it may be left absolutely unattended over long periods. Its unsuitability for P.O. work lies chiefly in its insensitivity.

At the P.O. wireless stations for ship service a continuous watch is kept day and night; the operator on duty wears the

At the P.O. wireless stations for ship service a continuous watch is kept day and night; the operator on duty wears the telephone constantly, and is always ready for a message addressed to him. A call device, howsoever devoid of limitations and objectionable features, would be of little service at one of these stations. There is, however, a considerable demand for wireless communication between the mainland and small outlying islands, or between the separate islands of a group. The department already has ten stations in use for this sort of communication, and with a suitable call device, or even without, these short-range land-to-land stations will probably become quite numerous. At the existing stations the practice is for one of the pair to call the other once an hour, or at other defined intervals; and seeing that the operator usually has also to attend to the land line, sell stamps, pay out old-age pensions, and perform other functions, precise punctuality cannot be expected. Consequently, such a method of working causes a good deal of annoyance and wastes much time. Fur-

This device was fully described in the Electrical Review of May 1st, 1914.—Eds.

thermore, in some instances that have arisen, it is desired, for life-saving purposes, to have the telegraph available day and night. For this class of work there is pressing and immediate need of a wireless call device.

need of a wireless call device.

Owing to the short range—maybe ten miles or so—over which these stations are required to work, difficulties from interference from ships are in many cases not very great. There is, however, one condition which must be satisfied in a call apparatus for this work, and it is a hard one to meet; the instruments must require no skilled attention from day to day.

The apparatus shown has been constructed with a view to

The apparatus shown has been constructed with a view to meeting this quite specialised want of the department.

The principal features of the device are as follows:—At frequent pre-arranged times—four times an hour in this apparatus—the clock switches in a crystal receiver of ordinary character, except that an extremely sensitive D'Arsonval galvanometer replaces the usual telephone. The receiver remains in circuit for a brief period only—about ½-minute in this apparatus. If the key of the calling station is held depressed throughout this period, the needle of the galvanometer is deflected into position between the jaws of a hit-or-miss device actuated by a local current. When the needle is in its undeflected position, the closing of the jaws is without effect, for the jaws are slightly staggered, like those of a bulldog; but if the needle is in place between them, it is gripped by the jaws, a local circuit is closed, a continuous-ringing bell relay actuated, and the bell rings. Any atmospherics or signals, whether of the appropriate wave-length or any other, and of whatever strength, are without effect unless they occur during the brief period of activity of the receiver. The probability of damage to crystals and of false calls is, therefore, reduced by the agency of the clock-switch in the ratio of 15 minutes to one-third minute, i.e., 120 times, whereas the delay to a telegram caused by this system of working cannot exceed 1 heurs.

to crystals and of false cans is, therefore, reduced by the agency of the clock-switch in the ratio of 15 minutes to one-third minute, i.e., 120 times, whereas the delay to a telegram caused by this system of working cannot exceed 4 hour.

Despite this safeguard, it must happen that the crystal will be "knocked off," in the wireless jargon, by atmospherics some time or other. A second line of defence is, therefore, prepared by the provision of two crystal detectors, which are used alternately. An instrument called, for lack of a better name, the mercury toppler, in addition to other duties, switches over after each period, so that the other crystal detector shall come into use at the next period. If, therefore, one of the detectors has been knocked off and a call is, in consequence, unsuccessful at one period, it can still be made a quarter of an hour later. Communication then being established, the failure would be reported to the defective station, and the faulty detector be replaced by the spare provided.

Except during the few seconds of activity, the detector is disconnected from the receiving circuit and short-circuited on itself, and is immune from any electrical damage.

Except during the lew seconds of activity, the detector is disconnected from the receiving circuit and short-circuited on itself, and is immune from any electrical damage.

The galvanometer is shunted so as to be dead-beat; when unshunted it has a period of about 15 seconds. As now set, the minimum deflection to make a call is about 5°, and this is produced by a current of 40-1 microampere; 20-1 microampere is considered a safe working current. The galvanometer is not harmfully affected by rapid vibrations.

In the absence of a suitable quick-acting relay of extreme sensitiveness, it is necessary to accumulate the energy of the received signal over some considerable time before a sufficiently emergetic response can be produced. In the call device dealt with in the last section, the accumulation takes place during the several seconds in which a slowly moving galvanometer coil is gradually deflected. It is also possible to accumulate the energy in an oscillating body, provided that the signal is intermittent and synchronises with the oscillation. This method of working enjoys a certain selectiveness which is not inherent in the other; it is the method adopted in the Peake device.

Whether the recompulator of energy has an oscillatory one

inherent in the other; it is the method adopted in the Peake device.

Whether the accumulator of energy be an oscillatory one or not, it must be capable of continuing the accumulation over a sufficiently long reriod.

In the second call device exhibited, Peake's reed vibrating at (say) 25 periods per second is replaced by the coil of a galvanometer oscillating at 10-1 period per second, i.e., 250 times slower. Consequently, if the decrements of the coil and reed were equal, signals would continue to add energy to the coil 250 times as long as to the reed. The gain in ability to accumulate energy from the signal is more or less proportional to the lengthening of the period of the oscillating system.

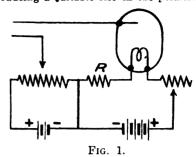

In this second call device, the galvanometer coil takes the place of the telephone in an ordinary receiver, and a swing is gradually built up from the sending station by keeping the key depressed during every alternate five seconds. Since the detector is always in circuit, a Fleming valve is used instead of a crystal, as the valve, though less efficient, is not liable to be knocked off by atmospherics.

The moving coil is cast with wax into smooth cylindrical form to reduce air friction. It has a resistance of nearly 6,000 ohms: is suspended by a stout phosphor-bronze strip, and has In this second call device, the galvanometer coil takes the

form to reduce air friction. It has a resistance of nearly 6,000 ohms; is suspended by a stout phosphor-bronze strip, and has a radial arm or tongue of fine platinum wire free to move between two fixed vertical platinum wires. The galvanometer constitutes a microwatt relay. The moment of inertia of the moving system (viz., 9.8 gm.-cm.²) has been adjusted to give a period of just 10 seconds.

The tongue is kept in mid-position between the side-contacts by the torque of the suspension balancing the torque due to the polarising current of the valve. This polarising current, which may be 10 or 20 times the current due to the signal,

is largely affected by variation of the filament current; and as the filament takes about half an ampere, the current in it must appreciably fall as the battery discharges. This might be a serious difficulty, but by use of the circuits shown in fig. 1, a fall in filament current is made to compensate for itself by producing a suitable rise in the polarising P.D. This

arrangement has proved remarkably successful. A variation of  $\pm$  10 per cent. in the filament current produces no perceptible deflection of the pointer; whereas without the balancing circuits + 10 per cent. rings the bell and - 10 per

balancing circuits + 10 per cent. rings the bell and - 10 per cent. nearly does so.

This call device possesses the merits of simplicity and robustness, and the present makeshift set will make a call with a signal of 0.063 microampere in about 2½ minutes, or with .14 microampere in about 1½ minutes. The sensitivity could, I feel sure, be considerably improved. The objection to this device for P.O. short-range stations is that the valve has a continuous consumption of some 4 watts, which is a serious matter when dry cells supply the power. This objection might be overcome, and greater sensitiveness obtained by the use of a crystal detector, if a non-earthed antenna sufficiently free from atmospherics were employed. sufficiently free from atmospherics were employed.

## RÖNTGEN SOCIETY.

At the meeting of the Röntgen Society on June 1st, the principal business was a discussion on the protection of the X-ray worker from the evil effects of the radiations with which he has to deal. The subject derived special importance, said the President, Sir A. P. Gould, in view of the extraordinary number of X-ray office which were being installed in military hospitals, both at home and abroad. These were often placed in charge of men having only scanty experience, who were called upon to work under circumstances of very great pressure, and the attention of manufacturers of X-ray apparatus and others should be called to the possibility of grave perils arising as a result of insufficiently protected equipments. Mr. Sidney Russ, D.So., said that he had been comparing the protective materials supplied with the installations of three manufacturers, who should be denominated X, Y, and Z. The lead rubber placed between the operator and the tube varied very greatly in different samples, as, for instance:—

Thickness of lead

Percentage of X-ray AT the meeting of the Röntgen Society on June 1st, the principal

				kness of lead ber in mm.	Percentage of X-ray energy transmitted.
X	•••	•••	•••	2 <b>.2</b>	1'4
Y	•••	•••	•••	1.24	49

Ż	•••	•••	•••	1.25	5.0
,,	•••	•••	•••	2.2	1.0
"	•••	•••	•••	3 75 ·	0'4
**	•••	•••		5.8	0.1

Lead glass, which was also used largely as a protective material, varied in a still more perplexing fashion, the absorptive power for the dangerous radiations bearing no relation to the thickness of the glass, but only to its density. Here, again, three manufacturers submitted samples, with the following result:—

				okness of lead class in mm.	Percentage of X-ray energy transmitted.
X	•••	•••	•••	<b>3</b> ·63	2.9
Y	•••	•••		3.87	5'5
••	•••	•••	•••	5 <b>0</b>	4.1
$\mathbf{z}$	•••	•••	•••	3.25	4 3
				3.65	3.4

As a dream of the future, Dr. Russ thought that before the radiologist began his work the atmosphere would be examined for sterilised. Mr. J. H. Gardiner, F.C.S., urged, with a view to guarding against secondary radiations, that X-ray tubes should be enclosed completely in a good thick case of thoroughly efficient and heavy lead glass. The protection of the tube in the plane of the anticathode was not sufficient, owing to the vagrant secondary radiations. The following resolution was carried: "That in view of the recent large increase in the number of X-ray installations, this Society considers it a matter of the greatest importance that this Society considers it a matter of the greatest importance that the personal safety of the operators conducting the X-ray examinations should be secured by the universal adoption of stringent rules, and that the Council of the Society be requested to meet at an early date and take steps to secure this end."

At the annual business meeting, Mr. J. H. Gardiner was elected President, and Mr. W. Duddell a vice-president.

### A GLASGOW HOSPITAL,

THE Royal Hospital for Sick Children, Glasgow, which was opened by the King and Queen in July last year, is a large establishment equipped on the most modern lines, and possesses an exceptionally complete installation of electrical appliances. Electricity is supplied by the Glasgow Corporation Electricity Department, through duplicate cables to each of two main switchboards in the basement of the building; a duplicate supply is furnished to the operating theatre, under local control.

Artificial illumination is provided for by nearly 2,000 metallic-filament electric lamps. Thirteen lifts and the whole of the laundry, kitchen and other machinery are operated by electric

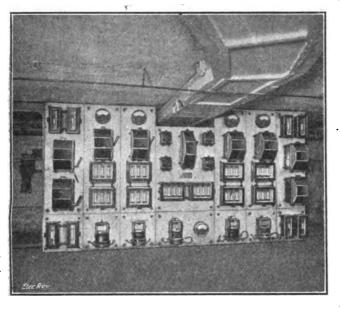

FIG. 1.—SWITCHBOARD IN MAIN BUILDING, SHOWING CABLE-CARRYING STRUCTURE.

motors, of which there are, in all, upwards of 40. Ventilation is effected entirely by electrically-driven fans. There is an extensive automatic intercommunication telephone system having 30 stations, in addition to the Post Office instruments, of which

30 stations, in addition to the Post Omee instruments, or which there are five with a central exchange.

The clocks throughout, about 30 in number, are electrically operated and controlled, as also are the several bell systems.

In addition to these ordinary utilitarian services there are the very extensive and varied uses of electricity in electro-surgery, Röltgen ray, high-frequency, and other special apparatus too numerous to mention in detail.

In the wards weneral illumination is obtained by central

In the wards general illumination is obtained by central pendants, so shaded that the actual lamps are screened from the

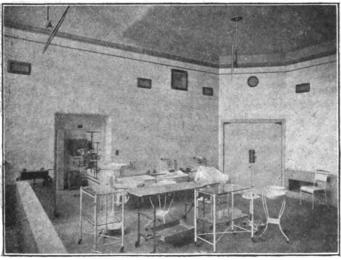

FIG. 2. - ONE OF THE OPERATING THEATRES. WITH TABLE ILLUMINATED BY REFLECTION.

bed positions. One of these pendants, in each ward, is of the inverted type to serve as a night light. By the bedsides, brackets

and special portable hand-lamps are provided for local use.

The corridors, passages and stairways have ceiling fittings in the form of an inverted cone, on the bottom of which the lamp is fitted. These cones are treated as a part of the ceiling and painted to match.

In the operating theatres an external source of light is employed for the operating tables. Arc lamp projectors are dustalled in an adjoining chamber, the beam of light being pro-

jected through a glazed aperture in the wall and on to the operating table by means of adjustable mirrors.

For the general illumination of the operating theatres special sunk fittings with flush glazed bronze covers have been employed. These frames fit into position by their own weight, and have no fixing stude or screws, but are nevertheless water-tight. The arrngements generally in the operating theatres are such that the walls may be washed down without risk or damage to any portion of the electrical fitments.

The whole of the internal electric light fittings are of plain smooth design to avoid so far as possible dust collection, and to

render them easily cleaned.

The laundry equipment includes washing machines, hydroextractors, ironing and finishing machines, and a large drying room above, served by an electric hoist. All the machines are

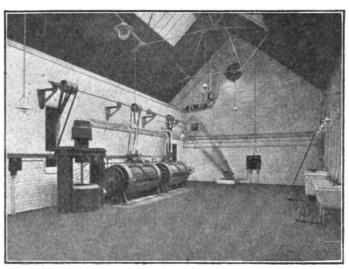

Fig. 3.-Washing House in Laundby.

electrically driven, some having the motors direct coupled, and

electrically driven, some having the motors direct coupled, and others being driven by belts.

We publish herewith some views of the plant, for which we are indebted to the consulting and advisory electrical engineers to the Board of Control, Messrs. James E. Sayers & Caldwell. The contractors for the electrical equipment generally were Messrs. Telford, Grier & MacKay; the electric clocks were supplied by the Magneta Time Co., Ltd.; the telephones by the Sterling Telephone and Electric Co., Ltd.; and the lifts by Messrs. Waygood-Otis, Ltd.

### SCIENTIFIC AND TECHNICAL COMMISSIONERS.

BY W. POLLARD DIGBY, Lieut, R.E. (T.), A.M.I.E.E.

(From the Journal of the Institution of Electrical Engineers. Abstract.)

MILITARY victory per se is not the only duty before us; the military victory once attained, success in the ensuing commercial warfare must be the essential objective. The comparative incidence of the burden of taxation after the war will be heavier than anything we knew before Europe mobilised. Capital will be very scarce, and exports of capital in the form, say, of engineering machinery or railway plants to neutral markets will probably be on a greatly reduced scale.

The organisation of industry, particularly with reference to oversea markets, is as important as the organisation of the intelligence service of a field army, and the better the industrial organisation of any manufacturing nation, the sooner will be the recovery from the aftermath of the war.

External aids to trade have received consideration, but it is a very open question whether all that can be done, has been done. The Commercial Intelligence Branch of the Board of Trade is the medium of conveying a great deal of Consular information con-cerning prospective trade openings in the Colonies or in foreign countries. Trade Commissioners and Commercial Attachés have been appointed, and it is with no idea of belittling the useful work that they have done that the author urges the selection of an entirely new type of official representatives to perform the duties of Technical Commissioners

Unless written by specialists, neither the reports of Commercial Attachés and Trade Commissioners, nor the Consular reports, can be reasonably expected to give details, say, of the successful types of competing foreign manufactures, the reasons of lower price, be reasonably expected to give details, say, of the successful types of competing foreign manufactures, the reasons of lower price, the reasons apart from price why British types are not successful, and the local conditions which may render typical British articles unsuitable. Such reports can only be adequately written by specially selected men situated in friendly countries, having behind them all the prestige of our diplomatic service. The men to be chosen for the duties must be of a high type. They must be recruited with as much care as the secretaries of our various

Embassies and Legations, but recruited differently. The modern side of a public school, and an engineering degree at Cambridge, Oxford, London, or Manchester, are by themselves wholly inadequate credentials for a Technical Commissionership. Industrial experience is as essential as the intervening years of sea service between leaving Osborne and a naval attachéship for officers in the

Navy.

The Technical Commissioner should be a specialist. Specialists acquainted with the needs of distinct industries must naturally ess an all-round knowledge of those branches of applied science most closely related to their own special work, and should possess imagination. Much, very much more than is supposed, of German success in the past has been due to the possession of a scientific and commercial imagination. If we look back on the history of the evolution of any branch of science, or even of any piece of machinery, it is at once evident that at any stage the next advance might have been predicted by the intelligent putting-together of the then ascertained achievements and phenomena.

There must therefore, be among the essential credentials of the

There must, therefore, be among the essential credentials of the technical commissioners evidence not only of practical experience and the power of succinct description, but of a logical imagina-

Visits of individual engineers abroad are directed mainly, if not entirely, to purchasing countries, not to competing manufacturing countries.

The author has yet to learn of an British firm maintaining an intelligence department in any foreign manufacturing city, concerned in no way with the sale of the firm's products, but with the sole duty of forwarding technical information to the firm's headquarters

The technical commissioner must be essentially a worker; he must make long journeys from his headquarters, and on his return must give a great deal of attention to office work. His minutes will be lengthy and numerous. He will have to avoid giving too much of his time to the social side of life.

The professional status of a technical commissioner, say, in engineering, should be at least the equivalent of full membership of one or more of the institutions most closely concerned in his work, viz., the respective Institutions of Mechanical Engineers and of Electrical Engineers. Those concerned with mining and of Electrical Engineers. Those concerned with mining machinery or metallurgical matters should belong, among other bodies, to the Institution of Mining and Metallurgy. The chemist, too, should possess equivalent qualifications. Before proceeding to take up his post, the newly appointed technical commissioner should have ample opportunity of conference with representatives of the industries concerned with his sphere of work, both as

but any manufacturer knows the technical information which h would like to have, and which could be furnished by a technical commissioner of the right type.

We shall be indeed a short-sighted race, if, when military war again gives place to the commercial warfare waged by manufac-turing countries for foodstuffs and luxuries, we do not strain every nerve to apply system to our methods. We must remember that the added burdens not only of direct taxation but of reduced numbers of food-getters will render commercial success more vital to our welfare than in the past. It is well within the bounds of feasibility that German industrialism may make a rapid recovery. Her factories and equipment are uninjured. Only raw materials and markets are needed for industrial production to be resumed.

Just as the important, and in some respects almost dominating position, which Germany held in the neutral markets of the world

position, which Germany held in the neutral markets of the world before the war was in part due to the thorough and systematic methods of her commercial engineering departments, so her innate genius of organisation and co-ordination, her capability of concentration of purpose, and her logical industrial imagination, will guide and steady her progress towards a recovery of her previous position. To this she will be relentlessly spurred by the grimmest of necessities, that of food earning.

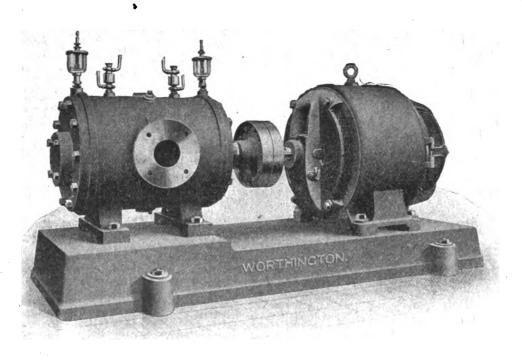

Mere exhibitions of German articles in London, with particulars of the wholessle and retail prices though good in their way will

of the wholesale and retail prices, though good in their way, will not suffice. We need representatives with technical experience and foresight studying conditions in the markets which we seek to supply. We can either leave this to sporadio industrial enterprise (generally an unsatisfactory quality, and undoubtedly expensive and inefficient), or make it a matter of national organisation. and as definite a branch of official activity as the duties of the Development Commissioners.

# NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Roto-Drum Pumps.

The WORTHINGTON PUMP Co., LTD., of India House, Kingsway W.C., have developed a rotary dry vacuum pump or blower suitable for direct coupling to an electric motor, as shown in fig. 1. The pump operates on the familiar principle of the rotating eccentric

FIG. 2.—OZONAIR DOMESTIC WATER STERILISER.

regards their selling and their technical departments and methods of manufacture. At stated intervals he should return to England to confer with those concerned in his work.

The technical commissioners should rank after, but be associated with, the present commercial attachés, assisting the latter by the preparation of the scientific and technical matter required for general reports. Prompt dissemination of the information, somegeneral reports. Prompt dissemination of the information, some-times perhaps in the shape of secret and confidential publications, will of course be requisite.

Au engineering commissioner for any particular branch of the industry would report on types of plant in use, study its operation, and send home recommendations thereon. He would join the engineering Institutions of the country in which his duties lay, attending annual meetings, congresses or conventions, and abstracting promptly important information in the technical papers.

It would be serve to mylicial interaction of contribute papers.

It would be easy to multiply instances of possible useful activity,

drum fitted with sliding steel plates which act as pistons; the plates do not rub on the inside of the cylinder, but are carried by hardened and ground steel running rings, which "float," so that no rubbing friction is set up. The shaft is carried on ball bearings, and all friction is reduced to the minimum. The casing is provided with a water jacket. The pump illustrated is capable of handling 20,000 cb. ft. of free air per hour at 700 R.P.M., and is very compact for the output. Ten sizes are made.

### Ozonair Water Steriliser.

MESSES. OZONAIR, LTD., of 96, Victoria Street, S.W., have devised a water steriliser of small dimensions for domestic use, which we illustrate in fig. 2. It consists of a metal frame which is fixed to the wall, and comprises a case containing the exone-producing apparatus above a bracket and swivelling tray to carry the receptacle for the sterilised water. The apparatus is quite automatic in action; on placing the jug in position and turning on the water tap, which is provided as part of the device, the ozone generator is set in operation. The steriliser is made for any ozone generator is set in operation. The steriliser is made for any type of supply and any voltage, and works on any water pressure from 12 to 50 lb. per eq. in.; the metal work is neatly finished in aluminium. Closing the tap stops the generator. The advantages of ozone for sterilisation are well known to our readers, and the system has been used for public supply abroad for many years, but a small British-made domestic plant has not hitherto been

## "Witton" Multiple Switch Starters.

The GENERAL ELECTRIC Co., LTD., of Witton, have recently supplied a number of multiple switch starters, comprising a mistake-proof starting switch cutting out sections of the resistance in the ordinary way and interlocked electrically with a circuit breaker.

In starting up a motor controlled by a "Witton" multiple switch starter, the circuit breaker is first closed, and the switch cutting out the first step in the resistance is then inserted. But

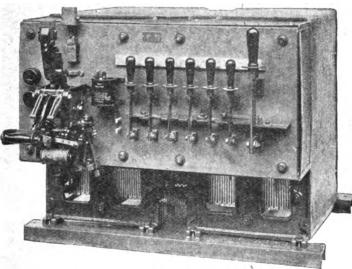

Fig. 3.—"WITTON" 100-H.P. MULTIPLE-SWITCH STARTER.

should an attempt be made to insert either the switch that short circuits the resistance or an intermediate switch on the starter, the attempt is frustrated by an interlocking bar. This bar is automatically moved along by the switches as they successively close, and precludes the closing of any of the other switches out of their proper sequence. Further, should the circuit breaker trip due to an overload on the motor and an attempt be made to replace it—which would mean short-circuiting the supply—a special trip

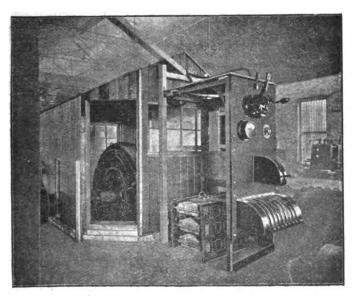

FIG. 4. - MULTIPLE-SWITCH STARTER FOR ROLLING-MILL Мотов.

coil on the circuit breaker is energised through contacts which are shorted when any or all the switches on the starter are closed.

shorted when any or all the switches on the starter are closed. The action of this trip coil locks the circuit breaker mechanism and prevents the breaker being closed.

The accompanying fig. 3 shows a "Witton" multiple switch starter for controlling a 100-H.P. motor, together with the necessary resistance and circuit breaker, while a view of a similar device controlling a 300-H.P. "Witton" rolling-mill motor is shown in fig. 4. In the latter case it will be observed that the switches are provided with a suitable cover,

### Renewing Tungsten Lamps.

There is a good deal more useful material in a burnt-out tungsten lamp than in a carbon-filament lamp, and naturally attempts to make use of it have not been wanting. Mr. Hedley Field, of the ALLIES ELECTRIC LAMP CO., LTD., Montgomery Street, Hammeramith, W., has just shown us a sample of such a lamp, in which the filament has been renewed, without using any freeh material other than the new filament. In this company's fresh material other than the new filament. In this company's process, the bulb is cut off at the shoulder, the glass is cleaned, and the new filament is mounted; a glass tube is then fused on to and the new mament is mounted; a glass tube is then rused on to the pip of the bulb, the latter is joined at the original cut, and to lamp is exhausted and sealed in the usual way. The company has been at work for about a year, and has applied the process to lamps of all sizes, from 8 to 400 C.P., for voltages up to 250 volts; the same efficiency is claimed as for new lamps, and the life of a renewed lamp is guaranteed to be not less than 1,000 hours. The appearance of the lamp is practically unchanged, and the operation can be repeated several times.

### WAR ITEMS.

Openings in Italy .- From the British Chamber of Commesce for Italy at Genoa we have received further lists of openings for British articles in Italian markets, from which we extract the following. Some of these firms formerly did business with German and Austrian houses, and now seek British connections:—

Glowing. Some of these arms formerly did husiness with ferman and Austrian houses, and now seek British connections:—
No. 680. Agent at Turin wishes to hear from manufacturers of machine tools. T.A.R.
No. 682. Agent in North Italy would take up agencies for scientific instruments. E.G.B.
No. 684. Electrotechnical engineer at Turin would represent British manufacturer of electric material and apparatus. T.S.G.
No. 686. Agent at Naples would represent manufacturers or shippers of steel, tools, machinery. N.G.B.
No. 686. Agent at Genoa representing British firms in other similar lines, has openings for electric lamps and apparatus. G.C.D.O.
No. 712. Firm at Florence would sell on commission in Tuacany, or merchant, machinery. F.O.G.
No. 718. Agent at Turin inquires for leather belting. T.G.B.
No. 718. Agent at Turin has openings for iron and steel, rain-water pipes, water-meters, steel tubes, anti-rust paint. T.P.F.
No. 719.—Rome agent would take up electric lamps. R.O.B.
No. 786. Agent at Genoa would sell on commission or merchant—copper, bronze, brass, zinc, aluminium, nickel, iron in pigs, electrical sheets of steel, for all Italy. G.E.A.B.
No. 789. Commission agent at Genoa has openings for anchors, warping machines, steering gear, thermotanks, steam and electric winches. B.
No. 764. Engineer at Rome wishes to represent important manufacturer of electrical material, motors, pumps, lifting machinery. R.A.F.
No. 789. Commission agent at Genoa wishes to hear from manufacturer of electric plancs. G.F.D.B.
No. 789. Commission agent at Genoa wishes to hear from manufacturer of machinery for paper mills, spinning mills, wool, cotton, linen, hemp, jute, workshops, files, linen and cotton yarns. B.C.F.
No. 780. Manufacturers at Bordighera would take up mechanical and electrical specialities. B.W.B.

"Munitions—Mere Munitions!" but "Keep the Atmosphere Pure."—Mesars. Connolly Bros., Blackley, Manchester, were summoned at Manchester, on June 2nd, for permitting a black smoke nuisance at their works.—Mr. Pickford (for the Corporasmoke nuisance at their works.—Mr. Pickford (for the Corpora-tion) said the magistrates had previously made an order for abate-ment on the defendants so long ago as December, 1900, and the nuisance was still existent.—Inspector Chisholm said that on April 20th he took observations of defendants' chimney, and in 30 minutes black smoke was emitted for a total period of 4½ minutes. When he saw the fireman the latter said he had been as careful as possible, and the emissions must be due to the bad coal they were getting.—Mr. Connolly said that when he was before the Court on April 7th last he read a letter which his firm had received from Lord Kitchener, showing that they were really working seven days a week to get out urgent War Office orders. They were still working on munitions and were at their wits' end to turn out the goods fast enough. He also read a letter from a colliery company, stating that for the present the firm would have to be satisfied with any kind of coal they could send, as they were crowded out with Government work. The works had been completely changed from steam to electric driving. Electrical machinery had been installed at a cost of £750, and an eighth motion was not in last week. machinery had been installed at a cost of £750, and an eighth motor was put in last week. He suggested that that showed that the firm were striving to meet the Corporation's requirements. They were taking all their power from the Corporation, and they had also had a complete transformer house erected for them by the Corporation. He thought the present summons might be withdrawn, and said he did not see how they could do any more than they had done to try to abate the smoke nuisance. They were working night and day on war contracts, and had even had to employ men 75 scent of arct to help them. and had even had to employ men 75 years of age to help them to get the work out. A fine of 30s, was imposed, the Bench intimating that whilst they fully appreciated the difficulties of the firm they had to maintain the purity of the atmosphere as far as possible. Mr. Connolly remarked that it was hard lines that the firm should be fined again. the firm should be fined again.

A Pocket Lamp Battery Syndicate. — The use of pocket electric lamps in Germany has assumed great importance among the rank and file of the army, and the production of batteries in particular has reached an exceptionally high level in recent months. A short time ago the battery makers were brought together in the form of a central organisation for war deliveries, and this has now been followed by the constitution of a syndicate of pocket-lamp battery makers at Charlottenburg, Berlin,

Anglo - Belgian Electrical Co-operation. — Writing with regard to M. R. Steylsers's paper on this subject, M. Nouet, Elitor regard to M. H. Steylaer's paper on this subject, M. Nouet, Elitor of our esteemed contemporary La Lumière Electrique, points out that several small errors have occurred in connection with the names and addresses of certain French firms: The Société Française d'Electricité A.E.G., 72, Rue d'Amsterdam, Paris, which was sequestrated (mise sous séquestre) on November 24th, 1914, included in its administrative council M. Thurnauer (not Thurnauw), ex-manager of the Thomson-Houston Co.. from which he has recently resigned. The address of the Société Industrielle d'Energie Electrique is 60 (not 30) Rue Cammartin, and M. Cohen d'Energie Electrique is 60 (not 30) Rue Caumartin, and M. Cohen (not Cahen) is a member of the administrative council of this company, as well as of the Socié é d'Electricité de Varsovie and of the Scoié é Continentale de Traction et d'Eclairage. our confrère finde the article interesting and accurate. much indebted to him for his kind assistance. Otherwise

Russia.—A firm at Ekaterinburg, who formerly represented German concerns, desire to get into touch with United Kingdom manufacturers of locomobiles, internal combustion engines, and electric lampr. "Correspondence with this firm should preferably be in Russian, and, failing this, French is the only other language in which they would be prepared to correspond." Communications in which they would be prepared to correspond." Communications in this connection should be addressed to the British Vice-Consulate, Ekaterinburg.

An agent in Warsaw wishes to secure the agencies of United Kingdom manufacturers of electric lamps and wire.

Inquiry is made for the names of United Kingdom manufac-

facturers of electric lamps and fittings, and carbons for arc lamps.

A firm desires to hear from United Kingdom manufacturers and

exporters of engineering supplies for factories and railways.

A firm wishes to get into touch with United Kingdom manufacturers of electric power plant, appliances for teaching physics

in schools, and lifts.

Manufacturers, &c., of the goods mentioned should apply, in the first instance, to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C., for the names and addresses of the respective inquirers. Farther communications regarding the inquiries should be addressed to the British Consulate, Warsaw.—Board of Trade Journal.

Commandeering Spelter.—According to the Times, the Munitions Committee contemplates issuing instructions to commandeer all spelter other than that being used for making cartridge metal, and prohibiting the use of spelter for galvanising sheets and wire, other than that for Government purposes. As a result of this no quotation for the metal was given by the Metal Exchange on Monday. The above action has become necessary owing to the difficulty of obtaining supplies of the metal, which are now obtained almost entirely from the United States. In normal times the United Kingdom's chief sources of supply are Belgium and Germany, which between them provide over one-third of the world's production. Since the war began Germany has prohibited the export of the metal. The last quotation for American spelter in London was £97 a ton, which compared with £22 before the outbreak of hostilities.

Australia and Enemy Goods.—The Sydney Morning Herald reports that on April 19th the Prime Minister, Mr. Fisher, received a deputation representing the Associated Chambers of Manufactures of the Commonwealth. It was asked that a 25 per cent. surcharge should be imposed on enemy goods for 10 years after the war. Mr. Fisher pointed out that when peace was declared there would be no enemy goods. It was then urged that the Commonwealth should bring in a three-schedule tariff on Canadian This would provide for preference to British goods, a lesser preference to most favoured nations, and an ordinary tariff for enemy goods. The Prime Minister indicated that already considerable preference was given to British goods. Under the new tariff he promised that the matter would receive full consideration by himself and the Cabinet.

Re Custodis, Ltd.—In the House of Commons, on Tuesday, Mr. Runciman replied to questions with reference to Custodis, Ltd., and the Alphons Custodis Chimney Construction Co. He said, according to the Times report, that both companies were incorporated in this country, and therefore entitled to carry on business here, but last Outober an inspector of the latter company was appointed by the Board of Trade, in order that the Board of Trade could be satisfied that it was not trading with the enemy. Whatever guarantees had been given by the company to others as to no Garman capital being involved, he must be guided by the register of the balders. of shareholders. It was an English company, with a majority of shares held by Germans—that was why an inspector was appointed.

Petrograd Electricity: Hitch in Procedure.—According to the Narae Vremya, the Petrograd Town Council having decided to buy out the three electrical concession concerns, namely, the Company, the Electrical Equipment Co. (formerly Helios), and the Belgian Co., the Governor of the town has protested. The alministrative body finds that the decision to purchase took place in contravention of the statutes of the town government, Specifically, the contravention consists in ignoring the regulation that all important questions affecting the town's economy may only be decided with a minimum attendance of 81, and with a majority consisting of two-thirds at least. The Governor protests that on the occasion in question the required majority was not

To Ourselves from "The Front."-A correspondent who is somewhere with the Forces (it is believed at the Dardanelles) writes home under date May 20th to a friend as follows:—"Next time the ELECTRICAL REVIEW man calls tell him that it reaches us every mail, and is read by a wide circle of engineers from every firm of any size in Britain. It always recalls your kindly forethought in arranging for it to be sent."

We are delighted to receive such messages as this from readers who are "doing their bit." We shall look for (may we soon receive) a letter from the writer from an address in Constantinople!

Anchor Volunteers.—About 80 men employed at the Anchor Cable Works, Leigh, Lancashire, who are engaged on Government work, last week joined the Leigh Athletes Volunteer Force.

War Munitions.—In the House of Commons, on Tuesday, it was stated that the approximate number of firms in the United Kingdom who had offered to manufacture munitions of war, but had not received direct orders from the War Office, was 300. these over 50 were engaged as sub-contractors. A question wa was asked as to whether the Chancellor of the Exchequer would give the names of firms who were being subsidised or guaranteed by the Government for the extension of their factories or the erection of new factories. Mr. McKenna, in reply, doubted whether it would be in the public interest to give the particulars asked for at the present moment.

Personal.—Mr. Percy Taylor, assistant electrical engineer to the Darwen Corporation, who recently joined the mechanical transport service, has been appointed mechanical staff sergeant,

transport service, has been appointed mechanical staff sergeant, and is in charge of a convoy of cars in South-East England.

Mr. Wilfred Pearson, son of Mr. J. Pearson, of the Altrincham Electric Supply, L'd., till recently with the 5th Cavalry Reserve Scots Greys at York, has been gazetted second-lieutenant and appointed to the East Yorkshire Regiment now at Harrogate.

Mr. Herbart Pearson, his brother, is with the King's (Liverpool) Regiment at Salishner. Regiment at Saliebury.

Mr. A. W. Empson, A.M.I.E.E., A.M.I.Mech.E, F.C.S., Mr. A. W. Empson, A.M.I.E.E., A.M.I.Mech.E., F.C.S., who recently resigned his appointment as chief station engineer to La Compania de Electricidad de Marida, Yucatan (Mexico) in order to serve in the British Army during the war, has joined the Motor Machine Gun Section, and is now in training at Bisley Camp. His permanent address is 14, Scarcroft Hill, York.

Mr. E. W. Davey, electrician, of 17, St. Andrews Road, Exmouth, has joined the Royal Flying Corps for active service.

Mr. A. Greed (meter tester), and Mr. J. Brooke (of the clerks' staff), of the Dewebury Corporation electricity department, have joined the Royal Engineers; and Mr. J. Passmore (shift engineer) has entered the Navy as electrical artificer.

Roll of Honour.—We regret to learn of the death from wounds (caused by a sniper's bullet) of Captain John Chapman, of the lat 5th Leicestershire Territorial Regiment. At the outbreak of war he held the rank of Lieutenant, but was shortly afterwards promoted Captain, and left with the regiment for the Front some time back. The regiment has been doing excellent work in the trenches. Capt. Chapman was a "Brush" boy, having served his pupilage with the Brush Electrical Engineering Co., Ltd., afterwards serving in the works electriciana' denartment, and latterly wards serving in the works electricians' department, and latterly being attached to the company's London office. He was a young being attached to the company's London office. He was a young man of attractive personality and of great promise in his profession, and his death at the early age of 26 years will be regretted by all who knew him. His popularity in his native town of Loughborough—whence the remains were taken for burial—and the sincere regret of his fellow-townsmen, as well as of the military authorities, at his demise, was demonstrated on Wednesday last week, when the honours of a military funeral were accorded preceded by a Church service at which representatives from all sides were present. The directors and staff of the Rymah Co. here sides were present. The directors and staff of the Brush Co. have conveyed their expression of regret and condolence to the bereaved relatives.

On May 26th, a bursting shell caused the death of Private rederick Vere Shanks, of the 1st-4th Battalion, King's Own orkshire Light Infantry. Private Shanks was employed in the Frederick

Frederick Vere Shanks, of the 181-14th Buttalion, Ring's Own Yorkshire Light Infantry. Private Shanks was employed in the electricity department of the Wakefield Corporation. Rifleman G. Frith, of Peel Green, Ecoles, who has died at a hospital in France from wounds received in action, was formerly

hospital in France from wounds received in action, was formerly employed by the British Westinghouse Electrical and Manufacturing Co., Ltd., Trafford Park. He was 20 years of age.

Intelligence has reached Torquay that Mr. C. Walker, of the Corporation electricity clerks' staff, has been killed in action; and that Mr. Harding, a stoker at the works, is reported missing from H.M.S. Goliath, recently sunk in the Dardanelle.

Lieutenant J. Lindsay Drummond, of the lat Royal Scots Fusiliers, has arrived at Dumfries on sick furlough. The lieurushiers, has arrived at Dumines on side intribugh. The heternant, who was an engineer in one of Glasgow's electric power stations before the war, went out to the Front in December. He was badly wounded in both ankles at St. Eloi.

Corporal A. E. Irving, of the Yorkshire Regiment, who worked

on the Burnley Tramways before the war, has been awarded the D.C.M. He displayed conspicuous gallantry at Neuve Chapelle on March 12th, when by throwing bombs on the enemy he cause to evacuate the trenches and come under the fire of his comrades.

Gateshead Tramwaymen and Red Cross.—As a result of their King's Theatre Matinee and Town Hall concert on April 21st (Gateshead and District tramwaymen), an amount of £91 was handed over to Whinney House for Red Cross purposes.

Denmark.-A firm in Copenhagen desires to secure the agencies of United Kingdom Manufacturers of electrical specialities and novelties. Apply first to the Commercial Intelligence Branch of the Board of Trade, London, for the name, and subsequently address the British Legation, Copenhagen.

### REVIEWS.

The Electric Furnace. Second Edition. By A. STANSFIELD, D.Sc. 1914. London: Hill Publishing Co. Price 17s. net.

The first edition of this book appeared in 1907, but since that time the science of electrometallurgy has made rapid progress, and, as a consequence, the present edition has been increased to more than twice its original size, and the whole text has been reset. The author states in his preface that all recent developments of importance have been included, but as the revision has occupied at least three years, it has been impossible to insert some of the most recent work on this subject. The purpose of the book has been to trace the evolution of the electric furnace from its simplest beginnings, and to set forth, as briefly as is consistent with clearness, the more important facts relating to theory and practice. There is no doubt that the author has achieved this object, and has presented a most interesting and instructive contribution to the literature of electrochemistry.

This volume covers not only the progress, but most of the essential features of the design and operation of electric furnaces, and should be of immense value to both the student

and the manufacturer.

The first chapter is entirely historical, and gives a brief survey of the development of electric furnaces to date. The next four chapters deal with the classification, efficiency, construction and operation of electric furnaces. Chapter II describes the essential features and classification of the various types of furnaces. Each class is clearly described, and diagrammatically illustrated. Chapter III is devoted entirely to questions of efficiency and cost. The economic relations between electricity and fuel heat are fully described and discussed. Furnace construction and design are dealt with in detail in the next chapter, which constitutes one of the most important features of the book. The opening pages give an account of the different refractory materials in use for furnace lining. The thermal conductivity of furnace materials is considered from both the theoretical and the practical standpoint. A few pages are devoted to the radiation and convection of heat, as a preliminary to a detailed study of the various types of electric furnaces. The whole chapter is fully illustrated with diagrams, curves and tables, and is clearly elucidated by means of practical examples. Chapter V treats of the operation of electric furnaces. It opens with an account of the different forms in which electric power is supplied at the present time, and the methods of coupling the supply of energy to the furnaces. Heat production, power consumption, regulation and control in furnace practice are all discussed in a clear and concise manner.

The next chapter opens the section treating of the various uses of electric furnaces. Chapter VI begins with a description of the various laboratory furnaces, followed by the large-scale process of steel smelting. Chapter VII introduces the possibilities of the production of pig-iron from its ores, a considerable amount of space being deservedly devoted to this youngest of electrical industries. The production of steel from metallic ingredients is described in Chapter VIII. The details of this branch of the electrometallurgical industry are now thoroughly well known, and need no

further comment.

Chapter IX describes the various attempts made to place the production of steel from iron ore on a commercial basis, but this must still be regarded as in the experimental stage. The manufacture of ferro-alloys and silicon is briefly dealt with in Chapter X, and the production of graphite and carbides in Chapter XI. A considerable amount of space is devoted to the electrometallurgy of zinc and other metals in Chapter XII. This section of the book is extremely interesting, but the industry can scarcely be regarded as having advanced beyond the experimental stage. Chapter XIII describes miscellaneous uses of the electric furnace. The production of nitric acid, phosphorus, and carbon bisulphide is illustrated therein. Various processes of the electrolysis of fused material are described in Chapter XIV, including the production of sodium, aluminium and calcium. The last chapter attempts to indicate the direction of

future development in electric furnace construction, and concludes a very interesting survey of the more important features of electrometallurgy.

The book is fully and clearly illustrated throughout, and freed as far as possible from superfluous details. The text is accompanied by numerous tables and curves. The mathematical and chemical portion of the book is of an elementary nature. Many pages are frequently devoted to the description of plant which has already proved inefficient. This procedure is necessary when it illustrates novel features in furnace construction. The value of the book would have been greatly enhanced had the author given details as to the cause of inefficiency, or at least indicated the reason for suspending operation. There is no doubt, however, that this book forms a very useful addition to our electric furnace literature. The writer is a recognised expert on this subject, and gives a considerable amount of first-hand information. The book will be generally recognised as a standard work on the subject of electric furnaces.

Electrical Engineering in India. By J. W. MEARES. Calcutta: Thacker, Spink & Co. Price 15s. net.

This volume represents a most successful attempt to provide a treatment of electrical matters such as is likely to be required by the engineer who, not having specialised in electrical work, wishes to extend his knowledge in this field or to solve some particular problem. The author has to solve some particular problem. succeeded in getting between the covers of a book of reasonable size and price, sufficient elementary matter to furbish up, if necessary, the rudimentary knowledge assumed to have been acquired at one time by the reader; and, in addition, a treatment of the subjects of domestic applications of electricity, installation methods and costs, electrical plant and supply, and sundry heavy-current applicationsthe treatment being throughout well suited to the end in view. The volume combines the technical merits of treatises on special branches of electrical engineering with the convenience in reference of a pocket book. So many attempts at covering such a wide field have ended in disastrous failure or cursory mediocrity, that it is particularly gratifying to find a work packed full of information, obviously selected with care and experience and set out in such manner that it can be understood and applied by any engineer, whether reading straight through the volume or using it as a work of reference.

Part I—the elementary section of the book—includes practical definitions and explanations of electrical terms and symbols, as well as brief notes on the chief electrical apparatus and machinery, and connecting and distributing systems. The author appears to have realised just what could be left out of elementary notes intended for engineers, and, while including no absurdly elementary or purely academic matter, he has left no gaps unbridged. In Part II, which is concerned with domestic applications and the cost and installation of the apparatus required, electric lighting, ventilation, pumping, heating and cooking are dealt with first, the information presented being a happy combination of descriptive and explanatory matter, and standard data required for general estimating and design and for installation work. The author does not commit the error, made frequently by "practical" writers, of giving arbitrary rules or mere generalisations and qualitative information; definite information and practical examples are given throughout, and where formation are included their examples. and where formulæ are included their conditions of applicability are specified. The chapters on wiring and accessories do not encroach upon the ordinary wireman's manual, but contain just the information (general and concerning sizes, capacities and costs) likely to be useful to the engineer called upon to specify and supervise a wiring installation.

Part III, dealing with electric plant and supply, is quite up to the standard of the rest of the book. Direct and alternating-current motors, their characteristics, control, applications and prices are treated satisfactorily, and Chapter XIV is devoted to the important subject of plant for private supply. Determination of the kilowatt capacity required is discussed in detail, brief notes relate to types of generators, and practical information is presented con-

cerning the cost and general characteristics of various types of prime movers. The possibilities of the Humphrey pump in this connection are discussed. Public supply costs are Public supply costs are analysed and the subject of tariffs is treated clearly, a number of actual examples being included. Two chapters dealing with water-power and its development include a useful collection of formulæ, standard data and general information concerning turbines, pipe-lines and associated Chapters on electric traction are equally valuequipment. able and contain even more definite data and instructions for its application. Electricity in mining is dealt with in the shortest and least satisfactory chapter in the book; we feel sure it is within the author's capabilities greatly to improve this chapter. Transmission systems, equipments and costs are treated clearly and in sufficient detail, and the last two chapters deal with specifications, depreciation and maintenance, and with testing.

The appendix includes the I.E.E. form of model general conditions of contract. An exceptionally complete index (occupying 33 pages) greatly increases the value of the work, and is the best we remember seeing. In proportion to its size, this book contains very few illustrations, but those included are excellent; it is free from diagrams useless to the readers for whom it is designed, and is unencumbered by the numerous half-tone illustrations, which so often mar We notice few printers' errors; there works of this nature. are one or two dropped figures or letters in mathematical expressions, but not where their absence can cause doubt or Two blocks are transposed on page 55, but the confusion. author informs us that this was due to the printers, after a correct proof had been passed. Some of the data included refer only to India, and Indian coinage is used throughout. The scope and quality of the book are remarkable and, we believe, unique. An Anglicised edition could be prepared easily and should meet a wide demand.—R. E. NEALE.

# LEGAL.

CALMONT, KING & Co. v. OWEN.

In the City of London Court, on Friday last, before his Honour Judge Atherley-Jones, K.C., a claim was made by Calmont, King and Co., Ltd., London, against Thomas H. Owen, cycle and motor dealer, Blaenau Festiniog, to recover £2 13s. 10d. for electric

lamps supplied to his order.

JUDGE ATHERLEY-JONES stated that the defendant had written JUDGE ATHERLEY-JONES stated that the defendant had written several letters to the Court, explaining why he should not pay the amount. Plaintiffs' solicitor stated that in October, 1913, plaintiffs quoted defendant for certain electric lamps to be supplied at fixed prices. These prices ruled only for the season. Deliveries took place at those rates, and then prices went up. Defendant now urged that he ought to have the latter deliveries of goods at the former rates. There were three invoices sent up by the defendant to the Court. The first was at the old prices, the second was at an extra price, which defendant had actually paid, and the third was the subject of the present action. The third was for £2 13s. 10d. Defendant had paid £1 8s. 4d. into Court, deducting £1 5s. 6d., the increased price on the old invoices and on the sum now claimed. Of course that could not be allowed. Defendant wanted deductions from amounts actually paid.

JUDGE ATHERLEY-JONES found for the plaintiffs for the amount claimed, with costs.

claimed, with costs.

BRISTOL TRAMWAYS AND THEIR ELECTRIC SUPPLY.

In the Chancery Division, on Tuesday, June 8th, Mr. Justice Neville had before him a petition by the Bristol Tramways and Carriage Co., Ltd., for the sanction of the Court to an extension of

its powers, including the supply of electricity to other firms.

Mr. CLAUSON, K.C., who, with Mr. GORDON BROWN, appeared in support of the petition, said they had surplus electricity which desired to supply to others.

His LORDSHIP expressed his approval of the proposed extension of objects, but thought that the notices convening the necessary

under these circumstances, MR. CLAUSON asked that the petition should stand over in order that fresh meetings might be held, and be restored to the list for formal sanction; or, should the company think that they could persuade the Court of Appeal to take a different view as regards the notices, dismissed, so that the opinion of the Court might be taken on the point.

His LORDSHIP said the order might go in either way, as the

company desired.

## BUSINESS NOTES.

Consular Notes.—CUBA.—Recent issues of the Gaceta Oficial announce that the following persons have been granted permission to install electric power and lighting plant in Cuba. Smor Francisco Arredondo y Bentancourt at Jobabo, in the municipal district of Victoria de las Tunas; Senor Dorindo Vazquea, in the town of Florida, Province of Camaguey, and Senor Perfecto Rodriguez, in the town of Florida. In each case the concession will be rescinded if the plant is not in working order within a year from the date of the concession.

DOMINICIAN REPUBLIC—The American Consult at Santo

DOMINICAN REPUBLIC.—The American Consul at Santo Domingo reports that the erection of a new electric light plant in Santo Domingo is so greatly felt that it is a daily subject of discussion in the local Press and by those who, realising the deficiency of the lighting service, are constantly clamouring for its betterment.

In June, 1914, a contract was entered into between the munici-

In June, 1914, a contract was entered into between the municipality and S. Michelena, whereby it was agreed that there would be created a Corporation, with a capital stock of \$160,000, \$60,000 of which would always be held by the municipality, with the object of establishing an electrical plant for the public and private lighting of the city of Santo Domingo and the supplying of power for industrial and domestic purposes. Among other things Mr. Michelena bound himself to attend to and complete the formation of the stock company within a specified period of time after of the stock company within a specified period of time, after which the work for the erection of the plant was to begin.

The municipal Council in its session of March 30th last passed a report rendered by the city's attorney, in which it was held that the municipality was not bound for the erection of the electric-light plant, and the contract with Mr. Michelena was declared rescinded. In the same session a Committee of three was appointed to study and take under advisement the form and the means for the realisation of the work. It was also resolved to

contract a loan for the installation of the new plant.

contract a loan for the installation of the new plant.

PHILLIPINE ISLANDS.— The American correspondent at Manila reports that Lucban, Tayobas Province, is to install a hydro-electric plant to supply light and power to the municipality. The proposed plant will cost \$30,000. The machinery will be purchased from American importers, and the plant will be ready for operation in August. The project will be financed by Filipino capital, through a corporation floated in the municipality. The power for the plant will be generated by the water of the Pagnight River, which flows through the municipality. The electric light and power station will consist of a Pelton water turbine, coupled to a General Electric alternator, a concrete dam across the river, to a General Electric alternator, a concrete dam across the river, a headgate, flume, penstock, a complete power plant, transmission and distributing line. The system will require 42,000 ft. of wiring and 1,600 ft. of flume line, with a capacity of 900 litres a second. Construction will begin at once. Luchan is one of the centres of the Phillipine hat industry. One of the incentives for constructing the new lighting and power system was the great need for better lighting in the houses where the hat industry is being conducted.

RUSSIA.—The Administration of Waterways of the Interior in Russia has prepared an explanatory note in regard to the project of law concerning the utilisation of water-power. The note mentions the latest technical improvements achieved in this direction during the last ten years. The utilisation of water-power is of special importance, inasmuch as the electrical energy obtained can be transmitted to considerable distances. Hydroelectric power can special importance, inasmuch as the electrical energy obtained can be transmitted to considerable distances. Hydroelectric power can be used in all kinds of industries where motive power is used, but it is of special importance in mining, electrochemical and metallurgical industries, and in the manufacture of a number of articles important in agriculture. Of the greatest importance, however, is the use of hydroelectric power in the exploitation of ways becomes a necessity in many cases, even for long distances. The 24 large rivers of European Russis, not including the Caucasus, can furnish 1,000,000 HP., and the hydraulic resources of Siberia have not yet been ascertained. The total supplies of water-power in Russis are estimated by some investigators at 12,000,000 HP. in comparison with the total supplies in Western Europe of 34,000,000 HP. Western Europe, as well as the United States, is covered with a network of hydroelectric installations which, in the principal countries of Europe, produce more than 3,500,000 HP. In Russia a considerable number of applications have been received during the last 20 years, which circumstance has proved the necessity for utilising the water-power, but the granting of concessions, as well as any activity by the Government itself, has been impeded by defects in the Russian regulations. Even in cases where the exploitation of water-power may be given over to private enterprise it is always closely connected with the interests of the State. The right of exploitation conferred on a private individual places him in a position to control industry which under existing conditions, the Government believes should private individual places him in a position to control industry which, under existing conditions, the Government believes should belong to it. The right of exploitation of the water-power, therefore, should be given to private individuals only on condition that it will be under the control of the State. The regulations which the Government propose to put into force to bring about this end have already been given in detail in the ELECTRICAL REVIEW.

Liquidations. — COAST DEVELOPMENT CORPORATION,

LTD.—A meeting of creditors was held on Tuesday last, June 8th, at Winchester House, Old Broad Street, E C.

BECK ENGINEERING Co., LTD.—A petition for the winding up of this company has been presented by the Sloan Electrical Co., Ltd., of Copradty House, Golden Lane, E.C., and will be heard on June 15th.

Engraving on Celluloid.—One of the arts in which we have been largely dependent upon Germany is that of engraving on celluloid, and we understand that the great bulk of engineers' on celluloid, and we understand that the great bulk of engineers rules, scales and protractors were obtained from that source up to the commencement of the war. We are therefore glad to learn from the UNITED METAL ENGRAVING CO., LTD., of 40, High Bridge, Newcastle-on-Tyne, that they have developed a process of engraving on white and clear celluloid which, they claim, is equal, or superior, to the German process. We have received samples of both kinds, a transparent protractor, which is a really beautiful piece of work, and a section of scales for a slide rule which merits high commendation. We trust that the result of the company's enterprise may be the capture of this important branch of German

Fire. -An outbreak of fire at Carron Iron Works, at Falkirk, did considerable damage, the grinding mills and grinding shops, with valuable machinery, including large electric motors, baing involved.

A Manchester Exhibition.—The Ironmongery and Hardware Trades' Exhibition, which was opened on June 3rd in the City Exhibition Hall, Manchester, is to close to-morrow, Saturday. Mr. L. A. McGeoch, president of the Ironmongers' Saturday. Mr. L. A. McGeoch, president of the Ironmongers' Federated Association, Inc., is chairman of the Exhibition. The exhibits include the following:—W. & T. Avery, Ltd., weighing machines; Carborundum Co., Ltd., abrasive materials; Carron Co., electric stoves and cooking and heating apparatus; Excelsior Fibre Co., Ltd., fibre goods; E. O. Walker & Co. (electrical contractors and engineers); G. D. Gibson & Co., Ltd., electric vacuum eleaners ("Doty," "Duplex" and "Dumore"), and electric motors for sewing machines; Eyre & Sons, Ltd., electric light fittings; and the Falkirk Iron Co., Ltd., who are making electric cooking ovens, grills, toasters, fires and other like apparatus.

For Sale.—Salford borough electrical engineer invites tenders for the purchase of 10 miles, 1'2 sq. in., and 2 miles, 1'0 sq. in., single L.T. paper-insulated, lead-covered cable.

The British Gas Co., Bristol, have for disposal about 40 tons of carbon from vertical retorts. Particulars are given in our adver-

tisement pages to-day.

Trade Announcements.—The sales and advertising departments of MESSRS. SIEMENS BEOS. DYNAMO WORKS, LTD, incandescent lamp and fittings department, Dalston, have now been transferred to 39, Upper Thames Street, E.C. From this address the combined lamp and supplies business will in future be controlled. The rearrangement has been made essential by the rapidly increasing turnover of Wotan and Tantalum lamps. Extensions in the manufacturing departments have been accomplished from time to time, and it will be remembered that exceptionally large premises at Shacklewell Lane were occupied some three years ago to provide store accommodation for the large stocks held by the company. Although this released a certain amount of space and to provide store accommodation for the large stocks held by the company. Although this released a certain amount of space and temporarily eased the situation, the introduction of new types of lamps, including gas-filled lamps, demanded that further extensions should be made. As a result Dalston Works will now be devoted solely to lamp manufacture, and the output correspondingly increased. It is also hoped that the centralisation of the lamps and fittings selling organisations will prove to the convenience of customers. All correspondence relating to "Dalston" material should be addressed to 39, Upper Thames Street, E.C.

MESSRS. NEVILLE, WILLIAMS & Co. have disposed of their business as follows:—The Ensign electric fires, heaters and cooking apparatus to Messrs, Ikin & Eads, Ltd., 47, Marylebone Lane, London, W.C., who will continue the branch of the business under the same name and management, and who will accept responsibility for all

name and management, and who will accept responsibility for all outstanding guarantees for heater units, and will continue to supply Ensign electric fires and heaters; the Varsulat varnishes, frosting

and colouring lacquers and insulating materials to Messrs. Bi-Metals, Ltd., 57, Lant Street, London, S.E.

MR. WILLIAM SWEETMORE, electrical engineer, of Heywood, Lincs., announces that he has removed to more central premises at 6, Market Street, Heywood.

Book Notices.—The Journal and Transactions of the Society of Engineers (Inc.), for May, contains a paper by Mr. A. H. Barker on "Heating and Ventilation" and a discussion thereon, both of which are of interest to electrical engineers, who

are in possession of the ideal means of performing these functions.

The Faraday House Journal for the Summer term contains a "Note on the Third Harmonic in Transformers," by J. Goodman; an article on "Interpolation," by Dr. Alexander Russell, and a variety of information regarding the fortunes of past and present students, including a supplementary list of those serving in the

Allied Forces.

"Constant Voltage Transmission." By H. B. Dwight. London:
Chapman & Hall, Price 5s. 6d. net.

Bankruptcy Proceedings.—T. Duesbury, Engineer, Electricity Department, Satton Coldfield.—Receiving order made June 4th on creditor's petition.

J. W. & T. W. TATTERSALL (Tattersall & Tattersall), electrical engineers, late of Willesden Lane, London.—Discharge suspended for three weeks from May 11th, 1915.

Australia.—From the British General Electric Co., Ltd., of Australia, we have received a useful hanging wall map of Australia.

Catalogues and Lists.—Dowsing Radiant Heat Co., Ltd., 89 and 40, York Place, Baker Street, London, W.—24-page illustrated and priced catalogue relating to "Hot-point" irons for industrial (laundry, tailoring, dressmaking and millinery) and domestic use, also "Eadisk" cookers, and "Belenus" boilers, branders, soldering irons and several industrial heating devices. Copies of the catalogue will be forwarded on application.

MESSES, L. ANDREW & Co., 2, Whitworth Street West, Deansgate, Manchester.—Price list of india-rubber hose, tubings,

Leclanché aud other batteries, bell wire, &c.

# LIGHTING and POWER NOTES.

Australia.—In connection with the agreements entered Australia.—In connection with the agreements entered into between the Sydney City Council and the Municipalities of North Sydney and Waverley, for the supply of electrical energy, the Electric Light Committee of the City Council has recommended that authority be given for the provision and laying of the necessary cables and high-tension network. The cost of the works proposed to be carried out in North Sydney is £31,000, and in Waveley, £10,500.—Sydney Morning Herald.

A company is being formed in Melbourne to take over the plant of the Toora (Vio.) Electric Light and Power Supply Co. and to extend the mains to Foster for the purpose of supplying electricity to the town. Under the new scheme it is proposed to utilise the Franklin River Falls, where there is an abundant supply of water, in lieu of the present gas suction plant.—Tenders.

Bangor.—PRICE INCREASE.—The City Council has adopted a recommendation of the Lighting Committee to increase the price of current for electric lighting to 6d. per unit.

Barrow.—Annual Report.—The report of the year's working of the electricity undertaking shows that the output had working of the electroity undertaking shows that the output has increased by 72 per cent. and the revenue amounted £26,585, as against £20,148 in the previous year. The gross profit was £12,718, compared with £8,689, the net profit £3,163, an increase of £2,650. The units sold reached 3,597,410, as against 2,081,317 in the previous year. The total cost per unit was 0'925d., as against 1'321d, in 1914.

-Loan Sanction, &c.—The L.G.B. has sanc-Batley.tioned the borrowing of £3,391 for the purposes of electric cable extensions; the Electricity Committee recommends that the surplus on the revenue account of the electricity undertaking should be applied to clearing off the debit balance on the suspense account. In respect of the cable extensions, the representations made by the Council in London have been of such a character that the electric cable extensions to Healey, Carlinghow and Bradford Road West can be proceeded with.

Belfast.—A Sub-Committee of the Council has been appointed to consider the entire question of the electricity department and its reorganisation, and to report to a special meet of the Council on or before the 24th inst.—Belfast News Letter.

Blackburn.—The Electricity Committee has decided to inform applicants for a supply of electricity in the Wilpshire district that, owing to the war, the Committee cannot see its way to proceed further with the matter at present.

Bradford.—Workhouse Lighting, &c.—The new electric lighting installation of the North Bierley B. of G., at Clayton, was formally opened last week. It had been considered that economy might be effected in regard to the lighting of the various buildings, the cost of gas for the previous five years being about £500 per annum. Two engines are being utilised of 18 and 40 p. H. perpentiusly and both can be used for diving the trace 40 B.H.P. respectively, and both can be used for driving the two 25-kw. dynamos or for laundry purposes. Current is supplied for 750 lights. The estimated cost of the installation is \$1,260. Mr. T. Roles, the city electrical engineer, has acted as consultant for the

The Corporation Electricity Committee has decided to make a contribution of £10 for the current year to the funds of the Engineering Standards Committee.

Bredbury and Romiley.—The U.D.C. has consented to overhead wires being erected in connection with the supply of electricity to the district from Stockport, provided that the cables are laid underground when the Council requires it.

Burnley.—The L.G.B. having intimated that it would not be prepared at present to sanction the raising of any further moneys for the purpose of laying ordinary service cables, the E.L. Committee has decided that the cost of laying and connecting of services be paid out of revenue.

Cheriton (Kent).—CAMP SUPPLY.—The Military authorities have erected a generating station on St. Martin's Plain, and overhead wires have been carried over the public roads without any arrangement with the U.D.O. The Council has decided to communicate with the authorities on the matter, so as to fix responsibility should any accident arise from the live wires,

Chichester.—RESTRICTED LIGHTING.—Owing to restricted street lighting, the Electricity Co. has allowed the T.C. a rebate of £100 on the public lighting contract, which has been cancelled. A new contract is based on a sliding scale of charges, according to the number of lamps used.

Colchester.—YEAR'S WORKING.—During the last financial year, the Corporation electricity department sold 1,658,596 units, an increase of 25,000 on the previous year. The revenue for the year was £18,110, and the gross profit £7,813; the surplus after meeting financial charges, £813, was carried to reserve. It has been decided to increase all lighting charges by id. per unit.

Continental. - Spain. - Two concessions have been granted, according to Industria e Invenciones, for the establishment of hydroelectric works for the generation of electric current for local lighting purposes. The site of one of these stations is on the River Molins, near Tobers, in the province of Burgos, and of the other on the River Mundo, in the province of Albacete.

Doncaster.—Proposed Loan.—The L.G.B. has suggested that the Corporation's application for sanction to borrow £2,500 for electrical service mains be deferred.

-Proposed Loans.—The L.G.B. has sanctioned a loan of £1,000 for new services on condition that the money is spent on work for the Naval and Military authorities only. The cost of other connections will be met out of revenue. With reference to an application for a loan of £6,000 for a 1,000-kw. set, the L.G.B. has pointed out that the circumstances justify a smaller machine being installed. The T.C. has decided to let the matter stand over matter stand over.

ANNUAL ACCOUNTS.—The report of the Corporation electricity department for the year ended March 31st last shows total receipts amounting to £25,669, and a net profit, after payment of all outgoings, of £2,928. During the year 330,000 more units were sold than in the previous year.—Dover Express.

-The report of the Corporation electricity department for the past year shows an increased revenue of £6,739 over the preceding year. Expenditure had increased to the extent of over £7,500. Dealing with the estimates for the current year, owing to the abnormal price of coal, &c., the expenditure is estimated at fully £13,000 over last year. From this must be deducted the net profit carried forward of £2,835. To cover the balance the estimates have been framed with 10 per cent, extra price on lighting 10 per cent, on tramways supply and 15 per price on lighting, 10 per cent. on tramways supply, and 15 per cent. on power. The accounts and estimates were approved.

Durham.—PRICE INCREASE.—The Newcastle Electric Supply Co. has increased the price of current supplied in the city by 02d, per unit for every 6d, by which the average quarterly cost of coal used is above 7s. per ton, or pro rata for smaller variations of cost.

-Street Lighting.—As the North Metropolitan E.P. Distribution Co. has not responded to an invitation to submit proposals for street lighting by electricity, the U.D.C. has decided to ask the Tottenham District Light, Heat and Power Co. if it is prepared to continue the lighting for a further year from July 1st on the terms contained in the existing contract

Frimley.—Prov. Order.—At a meeting of the D.C. on June 1st, it was reported that the York Town and Blackwater Gas Co. had written urging the advisability of delay in laying the E.L. cables; the Council decided not to acquiese in the company's proposed application to the B. of T. for an extension of time in which to carry out the obligations under the prov. order for E.L.

Gillingham (Kent).—The T.C. has decided to give a supply of current at 7d. per unit to Messrs. Goldsmith, for the Rainham Cement Works, providing the firm undertakes the whole responsibility of laying the cable, the Council to have the option of purchasing the same.

Gloucester. - Loan Sanction. - The L.G.B. has, according to a local paper, telegraphed its consent to the request of the Electricity Committee for permission to lay a main, at a cost of £1,500, to supply the Gloucester Railway Carriage and Waggon Co., which is engaged on Government work.

-INCREASED PRICES.—In order to meet the large increase in the price of coal, advanced wages, &c., the T.C. has increased the charges for current for lighting and power by 10 per cent, from July 1st.

Grimsby.—YEAR'S WORKING.—During the year ended March 31st the Corporation electricity department sold 2,787,298 units, showing a slight increase on the previous year. The year's working resulted in a net profit of £2,817, as compared with £4,061 in the previous year, and after making certain appropriations to capital outlay and for war charges, a balance of £721 remains for disposal. The engineer, Mr. Vignoles, points out that the first six months of the year were very satisfactory, but judging from the last current assigns less in revenue for your principle. from the last quarter, a serious loss in revenue from private consumers must be anticipated unless conditions change,

Hove.—The T.C. has been recommended to accept the revised terms of 5½d. and 1½d. p r unit for the first and succeeding hours respectively, submitted by the Brighton Corporation for current supplied to Aldrington, and is also recommended to increase

the charge for current to consumers at Aldrington from 5d. to 51d. per unit as from 30th inst.

Kendal.—The T.C., in consequence of the great increase in the cost of coal and other materials, has decided to advance the price of current to consumers for lighting by 1d. per unit, and to kinemas and to power consumers by 1d. per unit, the increase in each case being one-sixth.

Lancaster.—YEAR'S WORKING.—The annual report of the electricity department for the year ended March 31st, shows that the revenue amounted to £9,111, as compared with £9,185 in the previous year. The total expenditure shows a reduction of £135; there was a decrease of 8,967 units seld for lighting, and of 20,741 units for power. The total net profit was £410, as against £348, and this has been carried to reserve.—Lancaster Guardian.

London. — BATTERSEA. — The Electricity Committee reports having been in negotiation with the Fulham and Hammersmith B.C.'s, with a view to linking up the undertakings of the three municipalities. The estimated cost of laying two '15 sq. in. mains between Battersea—Fulham—Hammersmith is £17,441, to 1. be borne equally between the three Councils concerned. mittee recommends an agreement being entered into; the Finance Committee recommends application being made to the L.C.O. for sanction to, and the advance of, a loan of £5,814, the Council's

sanction to, and the advance of, a loan of £5,614, the Council a share of the estimated cost of mains.

POPLAR.—The Finance Committee of the B.C. has considered the report of the Electricity Committee on the disposal of the nets surplus of the electricity undertaking, for the year 1914-15. The Committee has deferred consideration of certain of the proposals, but recommends that the proposal to transfer £3,500 to the credit

but recommends that the proposal to transfer £3,500 to the credit of the general fund be approved.

ST. PANCEAS.—The Finance Committee of the L.C.C. has notified the B.C. that it is prepared to recommend the borrowing of £15,000 by the B.C. for a new 5,000 kw. turbine, subject to the B.C. agreeing to repay within one-half of the period now unexpired, the debt outstanding on the plant and machinery for which a term of 42 years has been granted, and which will on the introduction of the new machinery fall within the category of stand-by plant. The condition is not to apply to the 2,360-kw. of plant, which it is stated will be required for working plant in of stand-by plant. The condition is not to apply to the 2,360-kw. of plant, which it is stated will be required for working plant in daily use. The recommendation of the L.C.C. is subject to the consent of Treasury

consent of Treasury.

The B.C. has decided to adhere to its previous decision in regard to the reduction of outstanding loan periods and points out that the proposed £15,000 expenditure is very urgent, as the B.C. has already incurred liability for the amount in question.

In connection with the completion of the loan of £22,530 for new boilers at King's Boad electricity station, application is to be made to H.M. Treasury for consent to the borrowing of the amount as the additional boiler accommodation is very necessary.

Loughborough.—YEAR'S WORKING.—The past year's working of the Corporation electricity undertaking resulted in a gross profit of £2,992, as against £2,759 in the previous year, and a net balance of £104 remained after meeting all charges, as against £392 in 1914. During the year 929,000 units were sold; the maximum load was 559 kW., and the connected load 1,505 kW. The motors connected totalled 910 B.H.P., and the works costs at '836d, per unit represented a fall of '108d, as compared with 1914.

Luton.—Plant Extension.—In view of the necessity of increasing the generating plant to provide security in the supply to many firms engaged in Government work, the engineer, Mr. Cooke, has advised, and the Electricity Committee agreed to the purchase of a 3,000/3,700 kw. Ljungstrom turbine set, to be erected within six months, at a cost of £11,175. An additional air filter, cooling tower, and piping will bring the cost up to £14,450. Further, he recommends the erection of a sub-station and installation of two 500 kw. converters at a cost of £5,200; this building will provide accommodation for an additional 2,000 kw. of converting plant. High and low tension cables will also be required at an estimated cost of £6,000, making a total proposed expenditure of £25,650, the borrowing of which it is proposed to ask the L.G.B. to sanction.

Middleton.—PRICE INCREASE.—The Electricity Committee has increased the price of electricity from June 1st as follows:—For lighting purposes by \( \frac{1}{2} \)d. per unit, for motor power purposes by 12½ per cent.

Midhurst (Sussex) .- The Midhurst and District Electric Supply Co. has applied to the B. of T. for consent to use 400-volt overhead transmission lines at Midhurst, Easebourne and West Lavington.

Manchester.—The Ratepayers' Association has forwarded a letter to the Treasury urging that sanction should not be given at present to the carrying out of the £500,000 electricity scheme at Barton, as it would tend to draw skilled labour from work more immediately necessary for the prosecution of the war.

Morley.—Year's Working.—The annual report of the borough electrical engineer shows that the total expenditure for the past year was £2,284, as compared with £2,228 during the previous 12 months. There was a gross profit of £1,640 on a total revenue of £3,925, but after payment of interest on loans and sinking fund charges there was a net deficit of £301, as against £443 in the previous year.

**Vol. 76.** No. 1,959, June 11, 1915.]

Northampton.—New Power Station.—The Finance Committee of the T.C. has considered the proposals of the Northampton Electric Light and Power Co. to construct a new generating station on land on the south side of the river, opposite Midsummer Meadow. The Committee states it has no desire to hamper the operations of the company, but as the greater part of hamper the operations of the company, but as the greater part of the receipts of the undertaking are, and will continue, to be derived from consumers in the borough, and the borough funds will receive no benefit from the rating of the proposed station, which will be virtually wholly situated outside the borough; it has directed the town clerk to notify the B. of T. that the pro-posals are open to objection from this point of view, and to draw the attention of the company to the nuisance which might arise from smoke from the chimney stacks of the projected generating station. station.

Oulton Broad .- RESTRICTED LIGHTING .- With reference to the rebate for street lighting, which has been previously referred to in the ELECTRICAL REVIEW, the U.D.C. has offered the Electricity Co. 60 per cent. of its account during the time the restricted lighting is in force. This, it is understood, is acceptable to the company.

Peterborough.-YEAR'S WORKING.-The accounts of the electricity undertaking for the year ended March, 1915, show that the revenue amounted to £10,393, as against £10.231 in the previous year; the total working expenditure was £5,647, against £5,415. With interest, provision for repayments and capital expenditure out of revenue, the capital expenditure was £7,217 for the year .- Peterboro' Standard.

Reigate.—Infirmary Lighting.—The B. of G. has decided to adopt electricity for lighting the new infirmary; inquiries will be made of the T.C. as to rates for supply.

Rochdale.—Proposed Loans.—It is proposed that application be made to the L G.B. for sanction to the borrowing of £4,400 for electricity mains. The Board is also to be requested to consent to the borrowing of £20,171, to cover the amount payable to contractors on existing contracts, the whole of the expenditure having been sanctioned by the L.G.B. in March, 1914.

Rotherham.-LOAN SANCTION.-The Treasury has sanctioned the borrowing by the Corporation of £8,400 for the purchase of two water-tube boilers for the electricity undertaking.

St. Annes.—YEAR'S WORKING.—The annual report of the electricity works states that the revenue for the year amounted to £12,055, compared with £11,725 for the previous year. The total working expenses amounted to £6,573, compared with £6,211, and the total expenditure to £7,787, leaving a gross profit of £4,268. The gross profit was equal to 7.84 per cent, on the capital outlay at the commencement of the year. During the year 1,191,703 units were sold.

St. Helens,-YEAR'S WORKING.--The charges for elec-

tricity are to be increased by 10 per cent. from July 1st.

The revenue from the undertaking for the past year amounted to £30,179, and the total expenditure to £29,641, there being a net profit of £538.

Shipley.—Year's Working.—The income from the electricity undertaking for the past year was £13,226 and the expenditure £13,629, leaving a deficit of £403. The deficit is due increased wages and assessment and heavy expenditure on new plant.

NEW PLANT INAUGURATED.-Last week two new turbo-alternators were formally started up at the electricity works, and will replace the four original turbine sets. The new plant will halve the unit steam consumption of the original machines and facilitate supply to local factories.

Stretford.—During the past year the total number of units generated was 2,782,600, as compared with 2,726,355 in the previous year.

In connection with the lighting of Longford Hall, a cable is to laid from the street mains to the hall, at an estimated cost of

-YEAR'S WORKING.—The annual report of the Electric Lighting and Tramways Committee for the year ended the Electric Lighting and Tramways Committee for the year ended March 81st last, shows a total income amounting to £33,297, as against £32,986 for the previous year. The total works expenditure was £18,965, as against £18,562, including an allowance of £397 to men on military service; there was an increase of £1,400 on the loan charges, and the net result of the year's working was a profit of £1,786, as against £3,312 for 1914. The reserve fund amounts to £8,996. The profit has been carried to the rate account.

Tasmania.—The contracts made by the Hydro-Electric Co. have now been transferred to the Government, and Mr. Dickinson, of Messrs. Alfred Dickinson & Co., has accepted the position of consulting engineer.

The question of the utilisation of the power derived from this scheme has been under consideration, particularly in connection with the proposed electrical treatment of the Blythe River and other iron deposits. Owing to the large outlay that would be necessary for a steel rail-making plant, and in view of the fact that the Newcastle works are to specialise in that direction, attention has been directed to the possibilities of producing other marketable lines, such as steel fencing wire. It is assumed that a charge of £2 per H.P. per annum would pay the cost of the transmission line, and that on this basis the cost of manufacture would be less than by blast furnace smelting. - Commonwealth Engineer.

Tunbridge Wells,-Loan Refused.-The L.G.B. has refused consent to a loan for additional boiler plant and a new cooling tower at the Corporation electricity works, on the ground that there is no immediate necessity for the work. The Board has also decided to cancel £1,696—portion of a loan of £6,658 sanctioned on November 14th, 1907, and not expended.

Wakefield.—The Council has resolved to discontinue its opposition to the Stanley Electricity Order before Parliament. The Council has also decided to apply to the L.G.B. for sanction to borrow £4,000 for the remodelling and extending of the

destructor plant.

L.G.B. INQUIRY.—An inquiry has been held concerning the application to borrow £4,000 for extensions of the electricity undertaking. It was estimated that the sum asked for would meet the requirements of the department for two years. was no opposition.

-The Weaverham Electric Supply Co., Weaverham.-Ltd., has entered into a contract with the Weaver Refining Co., Ltd.. Acton Bridge, for a minimum supply of 50.000 units per Acton Bridge, for a minimum supply of 50,000 units per annum for three years.

West Bromwich.—The T.C. has decided to increase the price of electricity to all consumers 20 per cent. in order to meet the extra cost of materials and wages.

# TRAMWAY and RAILWAY NOTES.

Ashton-under-Lyne.—A deputation representing the tramwaymen employed by the three authorities in the Athton district, waited upon the authorities on the 4th inst., with a view to getting them to reconsider their refusal of an application for an increase of wages. It is understood that the authorities decided to adhere to their previous decision.

Blackpool,—Women Conductors.—Some 99 employes of the Tramways and Electricity Department are now on war service, and six men are on munitions service. The Tramways and Electricity Committee has authorised the engagement of 12 women conductors, authority also being given to increase the number in the event of these being insufficient. The women conductors will receive the same rate per hour as youths receive during their first year of service as conductors, but their hours will probably be

Bolton.-WAR BONUSES.-The application of the local branch of the Amalgamated Association of Tramway and Vehicle Workers for a war bonus of 2s. 6d. per week for motormen, overhaulers, cleaners and day labourers, has been refused. Other alleged grievances of the men have been referred to the manager and the representatives of the Association for mutual adjustment.

Bradford.—YEAR'S WORKING.—The working of the Corporation tramways during the year 1914-15 shows a net profit of £32,500, as compared with £29,500 the previous year. The total income was £305,000, an increase of £8,000 on 1913-14, representing 11\(^1\)40, per car-mile as compared with 11\(^1\)40. The expenditure totalled to £272,500, and included an item of £2,800 for war allowances. Rates and taxes were reduced by £2,000 on account of reassessment of the undertaking. The total mileage run was 6,372,000, as against 6,256,000. In connection with the Corporation's railless system, there was an increase in receipts of run was 6,372,000, as against 6,256,000. In connection with the Corporation's railless system, there was an increase in receipts of £2,800 consequent upon the opening of new routes in the city; the total income was £4,316 ( $5\frac{3}{4}$ d. per car-mile), as against an expenditure of £6,016 (8d. per car-mile), there being therefore a deficit of £1,700, as compared with £414 a year ago. During the year renewal of track absorbed £22,300 as against £17,600. The reserve and renewals account now stands at £75,208, and the total capital expenditure at £1,052,000, of which £440,000 has been repaid. repaid.

Buruley.—WAR BONUSES.—An application by the Corporation's tramway employés for a bonus of 3s. per week has been refused by the Tramways Committee, and the refusal has been confirmed by the General Purposes Committee.

Doncaster.—Proposed Loan.—The B. of T. has intimated to the T.C. that it is unlikely that the loan of £8,550 applied for for the tramway undertaking will be sanctioned.

London.—On Monday last a collision occurred between two L.C.C. cars near the main gates of the Arsenal at Woolwich.

Eleven people were injured, three seriously.

One effect of the recent strike of L.C.C. tramwsymen was a decrease in receipts, in two weeks, of over £53,653, as compared

with the same period of last year.

A new tube station at Maida Vale has been opened, on the line from Paddington to Queen's Park. The station is entirely staffed

Manchester.—The Tramways Committee has decided not to accede to an application from the Municipal Employés Association for an advance of wages on behalf of certain grades of workmen in the employ of the department.

At the City Council, on Tuesday, it was stated that the number of Corporation tramway employés who had joined the Colours was 1,925, and in a few weeks it would be 2,000. The cost to the city

was now £1,316 per week.

Rochdale.—The building of the new car-shed has had to be postponed owing to the impossibility of obtaining a loan for the purpose.

Sheffield.—Women Conductors. — The Corporation tramway department has decided to employ women car conductors and cleaners. Already 80 women have specially volunteered for this class of work.

The general manager of the undertaking has been requested by the Municipal Tramways Association to act as its representative on the Electric Vehicle Committee of the I.M.E.A.

Sunderland.—The Corporation Tramways Committee has decided to engage 12 women as car conductors.

Stalybridge.—The Dukinfield T.C. has decided to petition against the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board's Bill in the House of Commons.

-YEAR'S WORKING.—There is a surplus West Ham.of £272 on the working of the tramway undertaking of the Corporation during the year ended March 31st last. It is proposed to transfer this sum to the reserve and renewal funds. The expenditure amounted to £119,935, and the income credited to the revenue account to £152,212, which includes £3,786 in respect of receipts due from other authorities in connection with through running. It has again been found necessary to realise part of the investments to cover the cost of renewals, &c. The investments at March 31st stood at £15,613, after the foregoing realisations, but the whole of the reserve and renewals fund has now been carmarked for various purposes.

The B. of T. has given its sanction to the borrowing of £1,560 for the replacement of the controllers on the tramcars. In view of the desirability of confining fresh capital expenditure at the present time within the narrowest possible limits, the Corporation

has been recommended, at the request of the LG.B., to postpone the purchase of the 15 new tramoars until after the war.

# TELEGRAPH and TELEPHONE NOTES.

A Telegraph Spy Charge.—Abdon Jappe, a Dane, was remanded at Plymouth on Tuesday on charges of attempting to elicit for the enemy information respecting warships, and of possessing apparatus capable of tapping telegraphic and sending telephonic messages.

Australia.—The Post Office accounts for 1913 and six months of 1914 show a deficit on working of £53,547, as compared with £20,081 for the previous year. After charging interest, pensions, &c., the total loss was £501,456, compared with £407,102. pensions, &c., the total loss was sout, too, companies which awards affecting postal electricians and linemen. There were 132,699 telephones in use in the Commonwealth, and in five of the six telephones in use in the Commonwealth, and in five of the six States automatic exchanges had been opened or were under construction. A loss of £151,446 was incurred on the telegraph ranch, but the most serious loss was due to the telephone service, amounting to £296,424. Wireless telegraphy showed a deficiency of £35,656, compared with £11,599 in the previous year.

The capital expenditure on telephone lines and equipment, exclusive of trunk lines, was £1,125,625, and on telegraph and telephone trunk lines £267,242. The working expenditure in the telephone branch was £1,079,461, an increase of £149,549. A Committee was appointed to inquire into the large deficiency in

Committee was appointed to inquire into the large deficiency in connection with the telephone service, and its report is now under consideration; it is stated that immense economies are possible.

In accordance with the scheme approved by the International Time Commission of Paris, Melbourne radio-station is now transmitting time signals at the hours of noon and midnight, Melbourne which is 10 hours ahead of Greenwich mean time. - Wireless

Canada.—Our correspondent writes:—1,136 telephone canada.—Our correspondent writes:—1,136 telephone companies have made returns for 1914, compared with 1,075 in 1913. The miles of wire now in use amount to 1,343,090, an increase of 250,563 over 1913. In 1914, the urban mileage amounted to 926,947, the rural to 380,142. There is 1 mile of telephone wire for every six of population. The number of telephones in use is 521,144, or one for each 15.5 of population. There is no other country, except the United States, which can show so high

China.—The Government proposes to carry out an extensive plan for the installation of wireless telegraphy, especially in the North-Western provinces.—Eastern Engineering.

Pacific Cable.—The story that an attempt had been made to cut the cable at Bamfield, B.C., has been officially contradicted.—T. and T. Age.

Trans-Atlantic Wireless.—Wireless communication between the United States and Germany has been severely handicapped lately by static conditions prevailing in the North Atlantic at this season of the year. The wireless station at Sayville, L.I., has been frequently isolated from the sending plant at Nauen, Germany. The same conditions exist at the Tuckerton, N.J., plant. Such messages as are received at Sayville are, for the most part, fragmentary, or often impossible to decipher.—T. and T. Age.

United States.—The first daylight message from the new naval radio station at Darien, in the Panama Canal Zme, to the Navy radio station at Arlington, near Washington, was received on April 30th. The distance is 2,000 miles. The sending and receiving radius of the new Darien station is 4,000 miles. The radio installation at the Darien station is on the Poulsen are system, and this station will be the most powerful in the world using exclusively this type of equipment. Since the United States Navy has been in temporary control of the German radio station at Tuckerton, the Poulsen are system has been installed at that point and is being successfully used in communicating in daylight, as well as by night, with the station at Eilvese, Germany, over a distance of about 4,000 miles. The number of words handled each week averages about 10,000.—Electrical Review (U.S.A.).

Wireless Injunction.—The U.S.A. Circuit Court of Appeals has affirmed the order of Judge Hough, granting a preliminary injunction restraining the De Forest Radio-Telephone and Telegraph Co., the Standard Oil Co., of New York, and Lee De Forest from infringing the fundamental Marconi and Lodge patents relating to wireless telegraphy.—T. and T. Age.

Wireless Amalgamation?—According to the Financial News, the presence of Mr. S. F. St. J. Steadman on the board of the new Poulsen Wireless Co., the registration of which was announced in our last issue, is very significant. Mr. Steadman is the private legal adviser of Mr. Godfrey Isaacs, and his new directorship coincides with reports that the relations between the Government and the Meaning Company of the contract of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the Marconi Co. are not so intimate as they were, and that in future the Poulsen system is likely to occupy a more prominent position than formerly. It suggests that "the Poulsen people are tending to coalesce with those who control the Marconi Co."

Transformer testing apparatus.—
Aust. General Electric Co., £269.
Haes & Eggers, £329.
Aust. General Electric Co.'s tender recommended for acceptancs.

Insulator pins.—W. G. Watson & Co., Ltd., £64; W. Elder & Co., £100; Storey & Keers, £100; J. Sonnerdale & Son, £129; W. Adams & Co., £288, Messrs, W. G. Watson & Co., s tender recommended for acceptance.

Bradford.—The Tramways Committee has accepted the tender of the M. & G. Truck and Engineering Co., Ltd., for 100 tramear trucks at £87 each, and Mesers. Brown, Boveri & Co., Ltd.,

for 200 tramear motors at £110 each.
The Electricity Committee has accepted the offer of Messrs.
Hayward Bros. & Eckstein, Ltd., London, for glass flooring (switchboard lights) at Valley Road Electricity Works, at £118; also that of the British Westinghouse Co. for two oil switches.

Caledonian Railway.—The Edison & Swan United Electric Light Co., Ltd., has received a contract for Royal Ediswan lamps.

Chelmsford. — The Essex Education Committee has accepted the tender of Mr. E. C. Porter for the E.L. installation at the County High School for girls, Chelmsford, at £73.

Crewe.—The T.C. has accepted the tender of Messrs. J. Simon & Sons for best Great Row slack coal for the electricity works, at 16s. 10d. per ton, subject to satisfactory tests.

-The T.C. has accepted the tender of Messrs. G. B. Leach & Sons for coal for the electricity works for one year.

Dartford.—The U.D.C. Electric Supply Committee has accepted the offer of Meesrs. E. J. & W. Goldsmith, Ltd., to supply 890 tons of Rubbly Culm, at 19s. 6d. per ton delivered.

Hull.—The Education Committee received 10 tenders for the electric lighting installation and fittings for the new girls' secondary school. That of Messrs, T. W. Vaughan & Co., Ltd., London, at £1,009, has been accepted. It was pointed out that the tender was £400 less than any other, and it was suggested that a mistake had been made.

Leigh.—The following tenders have been provisionally accepted :-

Rotary converter, £895.—Bruce Peebles & Co., Ltd. Switchgear, £71.—Switchgear & Cowans, Ltd. Stirling boiler, £2,041.—Stirling Boiler Co., Ltd. Underfeed stoker, £408.—Underfeed Stoker Co., Ltd.

Meter Contracts.—The Wallasey Council has placed a contract for 12 months' supply of single-phase meters with the Electrical Apparatus Co., Ltd. The St. Annes U.D.C. has made a contract with the same company for 100 D.C. house-service meters

during the next 12 months.

Messrr. Chamberlain & Hookham, Ltd., have received contracts for meters for the coming year from Paisley and Wallasey.

The British Thomson-Houston Co, Ltd., has received a contract from Wallasey County Borough for 12 months' supply of S.P., A.C. house-service meters. Messrs. Ferranti, Ltd., have secured a contract for annual annual country of 1 c, meters for the same Corporation. contract for annual supply of A.C. meters for the same Corporation.

Sheffield.—The following tenders have been accepted by

Shemeld.—The following tenders have been accepted by the Electricity Supply Committee:

Underfeed Stoker Co., Ltd.—Renewal of mechanical stokers at Neepsend, 28,166.

Bridshaw & Co.—Two natural-draught water-cooling towers, including foundations and all fittings and accessories, 28,514.

E. Taylor, Ltd.—Excevations and building of reinforced concrete retaining wall at Neepsend, 22,246; also excavating trench and laying 21-in. cast-iron drain pipe, 2699.

The tender of Meesrs. Brown, Bayley's Steel Works, Ltd., has been accepted by the Tramways Committee for the supply of 500 steel trampar tires.

Stockport.—The following tenders have been accepted by the Electricity Committee :-

by the Electricity Committee:—

W.I. water-piping for exhaust, and 1,350 new stoker links.—Babcock and Wilcox, Ltd., £85 and £28.
Oil filter.—C. C. Wakefield & Co., £18 10s.
Stanchions for new orane.—Leah & Rowbotham, £109.
Patent roof-glazing, engine-house extension.—Mellowes & Co., Ltd., 1s., per sq. foot.
A.o. testing set.—Eckstein, Heap & Co., Ltd., £41.
Feed-water heater, with separator.—Worthington Pump Co., Ltd., £144.
20:in. valve for circulating pump.—Alley & Maclellan, Ltd., £19.
Circulating water screens.—F. W. Brackett & Co., Ltd., £400.
5-B.H.P. motor for driving screening apparatus.—McClure & Whitfield, £81.
The Health Committee has accepted tenders of Messrs. McClure and Whitfield for electric lighting, at £58 and £22 respectively.

Sunderland. — The T.C. on Wednesday accepted the following tenders: --

British Thomson-Houston Co., Ltd.—Bearings for split-pole rotary, Doulton & Co.—Stoneware insulators.
Key Engineering Co.—Cable ducts.
B.I. & Heisby Cables, Ltd.—E.H.T. cable and copper strip.

# North of England Institute of Mining and Mechanical Engineers.— Baturday, June 12th, At 2 p.m. At Newcastle-on-Tyne, General Meeting.

### NOTES.

Merchandise Marks Prosecution: Act monses Withdrawn.—Before Sir John Knill, at the Mansion House Police Court, on Wednesday, the British Thomson-Houston Co., Ltd., of Mazda House, Upper Thames Street, appeared to Co., Ltd., of Mazda House, Upper Thames Street, appeared to answer an adjourned summons charging them with having, on March 5th, unlawfully applied to the "one only electrophone," a certain false trade description, viz., the "one only B.T.H. Electrophone," contrary to the provisions of the Merchandise Marks Act (1887). A second summons charged the defendants with selling an electrophone to which a false trade description had been applied.

ME. Bodkin, for the prosecution, said that, as the result of a consultation, the Alderman would not be troubled further with the

consultation, the Alderman would not be troubled further with the case. Mr. Hammer, at whose instance these proceedings were brought, as the owner of the designs and patents which were mentioned on the last occasion, was advised, whether rightly or wrongly in law, that he was obliged to take these proceedings in order to prevent the further dispersal of these instruments, which contained his registered designs and patents, in order to preserve his rights therein, and to let it be generally known that he was not personally acquiescing in the dispersal or distribution of these instruments by way of sale. The defendant company fully appreciated this position, and they had made certain arrangements which were entirely acceptable to the prosecution. In view of this, he (Mr. Bodkin) would like to say that, so far as they were concerned, for the reasons he had indicated, there must not be any expressed or implied reflection upon the British Thomson-Houston Co., Ltd., for any part they had taken in the districonsultation, the Alderman would not be troubled further with the son-Houston Co., Ltd., for any part they had taken in the distribution of these articles. In the circumstances he asked leave to withdraw the summonses.

Mr. Hunter Gray, for the defence, said that, in the course of the last hearing, some question was raised as to the B.T.H. Co. having a factory in Berlin. This was not so. In point of fact these instruments came from an English company incorporated in this country, who have a branch in Germany. They were made by them and who have a branch in Germany.

sent to the defendant company.

Mr. Bodkin: The question of a sub-contractor now explains the contradiction.

Sir John Knill: I am pleased, indeed, to hear what you have said. The summons will be withdrawn. Fatalities.—FALKIRK.—Sheriff Moffatt conducted an inquiry into the cause of death of John McClumpha, engineer, who was employed in No. 1 pit, Polmaise Colliery. It was stated that he met with his death while engaged in repairing an electric coal-

he met with his death while engaged in repairing an electric coalcutting machine. When the repairs had been nearly completed the machine was set in motion before McClumpha got clear and he was caught by the teeth of the cutting disk, sustaining injuries which proved fatal on the spot. The jury returned a formal verdict in accordance with the evidence.

KIRKCALDY.—By falling from a gangway, James Philip (28), an electrician, was instantaneously killed while engaged in installing a system of electric lighting in the new cork mill of the North Lincleum factory, at Kirkcaldy. He was employed by Messrs, Melville, Robb & Scott, electrical engineers, Kirkcaldy.

BRIGHTON.—According to the Press reports of the inquest into the death of Ernest Percy Belcher, aged seven, who was killed on Volk's (Brighton) electric railway, one of the directors said that

Volk's (Brighton) electric railway, one of the directors said that strong wire netting was placed at two parts of the line, but youngsters brought pliers and cut it. Expert evidence was given to show that the maximum pressure never exceeded 170 volts. No accident like the present one had ever before occurred on the railway. The jury agreed that the line should be fenced on the south as well as on the north side, and that notices warning persons against crossing it at other than the recognised crossings should be erected. The company, it was stated, were prepared to do everything in their power towards making the railway safer. A verdict of "Accidental death through coming into contact with a live rail" was returned. There was no culpable negligence.

Development Committee. - At the last meeting of the Committee, held on April 16th, a report was received from the Publicity Sub-Committee on the work done with regard to a preparatory scheme for the production of printed matter on a co-operative basis.

Mr. Dunlop, on behalf of the B.E.A.M.A. Council, offered the use of offices and clerical assistance in connection with the routine work of purchase and distribution of such printed matter, at least during the early stages of the work, and the Committee expressed its appreciation of this offer.

It was resolved that Mr. Courtenay, of the General Electric Co.

should act on the Publicity Sub-Committee in place of Mr. C.

Palmer, at present on active service.

A report was received from the Electrical Installations Sub-Committee, and considered.

A report was also received from the Domestic Appliances Sub-Committee, outlining a preliminary scheme for certain technical investigations which the Committee hopes to put in hand at an early date.

The Committee recommended the inclusion of Mr. Shaw, of Worcester, and Mr. Wilmshurst of Derby, as members of this Sub-Committee, also that from time to time members of manufacturing firms should be co-opted for advice and assistance in regard to specific objects which might be considered helpful to the work of the Development Committee.

In discussion it was pointed out that although depletion of staffs and restrictions placed on borrowing money must considerably

hamper development work, yet there remained with most undertakings a large amount of new business to be obtained with very little expenditure, and therefore there still existed room for seletive canvassing and publicity work which might be directed to helping manufacturers and traders under the present difficult cosditions, if electricity supply were put forward more particularly in regard to power, on the strength of its real time and labour saving advantages, and not merely as an improvement on existing conditions.

The Scoretary reported the correspondence he had had with Mr. Wakeman, Society for Electrical Development, New York, and the Committee instructed him to thank Mr. Wakeman for material committee instructed nime to thank Mr. wakinan for material sent and offers of assistance and co-operation, which the Committee appreciated very much, and to express the hope that under more favourable conditions in the near future further development in

this direction might become possible. The next meeting will take place on June 16th.

Institution and Lecture Notes.—Physical Society

Institution and Lecture Notes,—Physical Society of London.—At the meeting held on May 28th, a paper "On Numerical Relationships between Electronic and Atomic Costants" was read by Dr. H. S. Allen, and one "On a Method of Calculating the Absorption Coefficients of Homogeneous X-Radiation" was read by Mr. H. Moore.

Two experiments illustrating novel properties of the electron currents from hot metals were shown by Prof. O. W. Richardson The first demonstrated the cooling of a tungsten filament when an electron current was allowed to flow from its surface. This effect is analogous to the cooling due to latent heat when a liquid evaporates, or to the similar phenomenon due to the heat of reaction when a gas is emitted by chemical decomposition of a solid.

The second experiment demonstrated the flow of electron currents from a hot filament to a surrounding cylinder against various opposing P.D.s up to about 1 volt. The data can be used to find the velocities of the emitted electrons.

A short account of recent experiments on High Permeability in Iron was given by Prof. Ernest Wilson.

Liverpool Engineering Seciety.—Prof. E. W. Marchant has been elected chairman for the coming year.

Association of Consulting Engineers (Incorporated).—
The annual general meeting was held at Caxton Hall, Westminster, on Monday, May 31st, 1915, Mr. G. Midgley Taylor presiding. The chairman moved the adoption of the report of the Committee, and stated that the Association had recently elected several prominent engineers to memberahip, and from what could be gathered by conversation with consulting engineers generally, the Association was held in high esteem. It was evident that the Association was need in high esteem. It was evident that the Association coccupied a very strong position, and in course of time, when its usefulness became better known, it was anticipated that it would include in its ranks the majority of the consulting engineers not only in Westminster, but also in the United Kingdom. One of the heaviest tasks undertaken by the Committee was a consideration of the Model General Conditions of Contract was a consideration of the model General Conditions of Conductions issued by the Institution of Electrical Engineers to which considerable objection had been taken. It was felt that general conditions of contract should be applicable to contracts generally, and that works pertaining to the electrical branch of the profession should not require any special treatment. The objections were communicated to the Institution of Electrical Engineers, and the Association was then head for its vices. Association was thanked for its views.

During the past year the Book of Professional Rules and Scale

of Fees had been revised, and, judged by the number of applications received for the book, not only from members of the Association but from Government departments and the engineering profession

generally, it had been found of great general utility.

Although membership of the Association was confined to prin cipals of firms, there were no fewer than five of its members serving

with His Majesty's Forces.

The adoption of the report was seconded by Mr. W. J. E. Bianic, and carried unanimously. The hon, treasurer, Mr. S. R. Lowcock then presented his report, showing a balance in excess of expecture of £65, compared with £13 last year.

Four London and two country members of the Committee having actions has noted than the ballot for new manufacturers.

retired by rotation, the ballot for new members resulted

follows:

The four London members elected were Messre. W. Ll. Press. W. J. E. Binnie, Ernest L. Maneergh, and E. Brough Taylor The country members elected were Messre. Walter Enmon. (Halifax), and F. W. Hodson (Loughborough).

The report shows that six new members have been elected during the year, and the membership now stands at 74.

American Institute of Electrical Engineers.—On May 18th. Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Co., was elected president of the Institute.

Electric-Light Switching Competition. — Mess. A. P. Lundberg & Sons inform us that the overseas results of the competition or examination published in November last are as follows :-

Advance-Grade Certificate.— -R. Drilhov, Pau (B.P.), Fran Intermediate-Grade Certificates.—H. Christall, London, Ontario S. W. Ghosh, Calcutta.

Preliminary Grade Certificates.—E. H. Asavaid, Bombay; P.N. Chiney, Bombay; J. J. Irani, Poona; J. Rustomji, Bombay.

Patents and Alien Enemies.--The Board of Trade has granted a licence to Mesers. R. S. Wright & E. E. Burnside 12 respect of Patent No. 25,101/12, granted to Bauer,

Alien Partners.—In a circular letter to the Press, Mr. Harold Benjamin draws attention to the case of Englishmen who have in partnership with them gentlemen, born alien enemies, who have become naturalised here; whilst most of these naturalised partners are men whose integrity is above all suspicion, the firms with which they are associated are suffering very much undeserved hardship as a consequence of the present strained feeling in commercial circles towards naturalised alien enemies. feeling in commercial circles towards naturalised alien enemies. As a case in point, an Englishman is in a large way of business, in partnership for a term having many years to run with a German-born gentleman who has been in England a good many years and become naturalised, but whose name is strikingly Teutonic. Since the war, and particularly during the last month or so, the English partner has practically had to do all the work, and his partner remains more or less in retirement, but, nevertheless, is entitled to his moiety of profits, and such profits are being seriously affected as a result of other firms' disinclination to continue to do business with a firm having an Englishman in partnership with a former German. The English partner has it put plainly to him by important customers that they decline to do business with his firm solely on account of his partnership and the firm's name; it would not help matters to alter the firm's name so long as the partnership subsists, and it is a fact that Englishmen firm's name; it would not help matters to after the firm's name so long as the partnership subsists, and it is a fact that Englishmen in such positions as the one mentioned stand to suffer heavy losses because they are saddled with partners who are, perhaps naturally, as it is their livelihood, disinclined to retire voluntarily.

If English partners in such circumstances put their heads together, Mr. Benjamin thinks they could address themselves to the Government on the subject, with a view to seeing whether some, and what, legal relief should be accorded.

Exhibition Space Contracts in War Time.—At the Westminster County Court on Monday, Lips, Ltd., lookmakers, sued Walter Cawood, Ltd., organisers of a Shipping and Engineering Exhibition which was to have been held at Olympia last year, and C. H. Luke and F. W. Bridges, organising managers, for the return of £9 paid as deposit for allotment of space at the exhibition and damages for the exhibition not being held. According to a report of the case appearing in the Financial Times, defendants did not agree to the postponement of the exhibition unit 1916 or 1917. The defendants gave as one reason for the exhibition not being held in 1915, that exhibitors engaged on Admiralty and War Office work could not prepare suitable exhibits in time, but plaintiffs maintained that an exhibition this year would have attracted a great deal of attention, and would have been a very great success. Defendants said that the overwhelming majority of the exhibitors wanted the exhibition postponed. Judge Woodfall gave judgment for the plaintiffs for £9 and costs, with leave to defendants to appeal. In doing so, he said that he thought that the extreme probabilities were that the defendants had taken the wisest course, not only in their own interests, but in the interests of exhibitors. Exhibition Space Contracts in War Time.—At the not only in their own interests, but in the interests of exhibitors. The question arose as to how far the outbreak of the war relieved one from the performance of a contract. So far as the law applicable to that problem was applicable to the present case, it was sufficient to say that because it made a burden and inficted a hardship, that was not a ground to relieve defendants from their obligation.

Aluminium Solder.—Referring to the paragraph in our karangahape Road, Auckland, N.Z., informs us that Mr. Overend and he have made further progress, and can now solder any metals together by their process. Aluminium, or any other metal or alloy, can be soldered to cast-iron and other metals, and a variety of solders can be used. The process is applicable to aluminium cables, and can be used. The process is applicable to aluminium cables, and tests are in progress to ascertain whether boiling water has any effect on such joints; at the time of writing no deterioration had been observed. Aluminium terminals, we are informed, can even be soldered direct on carbons, instead of casting lead tops on them. The statement that the Government had placed an order for 100 terminals was not correct, but the Government is inquiring into the merits of the process. We understand that the method can readily be taught to any mechanic in a few minutes. Mr. Grinlinten has sent us samples of the solder adhering to aluminium. aluminium.

New Rays.—It is reported from New York that a new electrical ray, discovered by Mr. Charles Stanley, is being investigated by the Government Department of Health. It is claimed that Mr. Stanley's invention does all that it is possible for the X-rays to do, and more, because the surgeon would be able to seek for bullets in a wound without fear of burning. There is no danger to the operator or patient.

Professional Classes in War Time.—A meeting in support of the Professional Classes War Relief Council was held on the 1st inst., and was addressed by Sir John Simon and others. It was stated that the Council was spending £430 weekly; at the outset between £3,000 and £4,000 was subscribed, but the income was falling off, and unless the receipts were increased the work of the Council would come to an end within three months. At least £25,000 was needed to carry on the work in the coming year.

Appointments Vacant.—Electrical foreman (£280 +)for Federated Malay States Government Railway; foreman overhead lineman for Bolton Corporation Tramways; shift engineer (£2 7s. 6d.) for Warrington Corporation; resident assistant engineer (\$5s.+) for parish of Willesden. Particulars are given in our advertisement pages.

Volunteer Notes .- SED BATT (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion orders, by Colonel S. G. Grant (Officer Commanding).

MOTOR-CLARS.—It is proposed to entertain wounded soldiers from various military hospitals next Sunday afternoon at Wambley Camp. Members desirous of lending their motor-cars for this purpose are requested to communicate immediately with the Adjutant, stating seating accommodation available.

### WEEK-END PARADES.

Saturday:—Route March. Battalion will parade at Baker Street
Station at 2.30 p.m. Train to Wembley Park. Drums and
bugles will attend. Note.—Particular attention will be paid to march discipline.

Sunday: -6 a.m. Reveille.
10 a.m. Church Parade.

10.20 a.m. Battalion Parade under Adjutant. 2.15 p.m. Battalion Parade under Commandant.

A. G. JOINEB, Captain and Adjutant.

1

Educational.—MANCHESTER MUNICIPAL SCHOOL OF TECHNOLOGY.—The Session 1915-16 will commence on October 5th. Matriculation and Entrance Examinations will be held in July and September. Further particulars are given in our advertisement pages to-day.

Inquiries.—Makers of celluloid boxes for accumulators, and the Helier battery, are asked for.

Prices Advance.—Messrs. Ercole, Marelli & Co., London, E.C., announce that, owing to the increase in the price of raw materials, all their prices are increased by 10 per cent.

Foreign Trade.—THE MAY FIGURES.—The following are the electrical and machinery figures given in the official returns for May :-

Ricotrical goods and apparatus, excluding ma- chinery and un- insulated wire	Month of May.	Ino. or dec. £ — 39,269		Fire months, 1915. & 371,300	_	Inc. or dec. £ 308,944
Machinery	801,889	+	64,466	3,453,720	_	1,565
EXPORTS.  Electrical goods and apparatus.						

excluding ma-chinery and un-insulated wire

233,560 - 153,268 1,193,192 - 289,757

 $\dots$  1,830,300 -1,566,586 7,944,539 -8,426,634

Insulated Zinc Conductors.—It is reported that the use of zinc wire, insulated with regenerated rubber, has been sanctioned in Germany during the war, as a substitute for ordinary rubber-insulated copper leads for low-pressure installation work. Although having a lower conductivity, the insulated zinc conductors are declared to have proved to be a practical and appropriate substitute, and the Sales Bureau of the United Makers of Insulated Wires announces that deliveries are now available.

The Metric System.—The report of the Decimal Asso-The metric system.—The report of the Decimal Association for 1914 states that since the outbreak of the war public interest in the metric system has very greatly increased; many inquiries have been received by the Association, and several daily papers have advocated the adoption of the system. The trend of opinion is that if decimal coinage were adopted in this country, the public would soon demand a decimal system of weights and measures, and therefore the Association has resolved to give precedence to the question of coinage. On March 17th 1915 the cedence to the question of coinage. On March 17th, 1915, the Association of Chambers of Commerce of the United Kingdom unanimously resolved that the immediate adoption of the metric system would be a valuable means of assisting British firms in their competition in countries where that system is in vogue. The metric carat came into force on April 1st, 1914, and has given general satisfaction; on May 1st, 1914, an absolute unit of barometric pressure and metric measurements of rainfall were adopted

metric pressure and metric measurements of rainfall were adopted for official records. In the new British Pharmacorceia all weights and measures are given in the metric system. Further progress has been made in the use of the system in the textile industries. British representatives abroad are pointing out the futility of issuing catalogues in terms of British weights and measures. The Committee of the British Society in the Argentine Republic unanimously holds that the most expeditious way to capture German trade in Latin-America would be the adoption of the decimal and metric systems. American Consuls are urging upon their country the urgent necessity of adopting the metric system. China has instituted a set of weights and measures based entirely on the metric system, the sole standards being the metre and kilogram. kilogram.

The secretary of the Association, Mr. G. E. M. Johnson, is on active service with the Honourable Artillery Company.

### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Mr. ALEX. McIntosh, who went from Edinburgh in 1900 as meter superintendent and consumers' clerk to the Woking Electric Supply Co., has now received the additional appointment of mains superintendent to the com-pany. Mr. Jewell, who for the last 16 months has been mains uperintendent to the company, has severed his connection with

superintendent to the company, has severed his connection with the undertaking.

It is announced that CAPT. GRAY, of the Howitzer Brigade, B.F.A., borough electrical engineer of Accrington, has become engaged to Miss Lillie Boyle, youngest daughter of the late Mr. Robert Boyle and Mrs. Boyle, of Blackburn.

The Gillingham (Kent) T.C. has increased the salary of Ms. A.C. LINES, commercial assistant at the electricity works, to £140 per annum. annum.

MR. R. W. KLITZ, the chief assistant of the borough electrics engineer, Wimbledon, has applied for leave of absence to enable him to join the Army for the duration of the war.

Conformably with his recent election, Mr. Alan A. Campbell Swinton was on June 3rd admitted a Fellow of the Royal

Boolety.

The Bury T.C. has increased the salary of Mr. S. J. WATSON, electrical engineer, from £550 to £650 per annum.

Mr. F. C. Leese and Mr. A. E. Leese, sons of Ald. Leese, who recently resigned their positions under the Stoke-on-Trent Electricity Committee, have been presented by their former colleagues with a Gladstone bag each. The presentations were made by Mr. C. Cuthbertson, resident engineer of the Stoke works, supported by Mr. S. G. Marston, mains superintendent for the southern ares. Mr. F. C. Leese had been a mains inspector of the southern area for 11 years, and his brother had been a switchboard attendant for two years.

Tramway Officials,-Mr. J. F. CAMERON has been appointed general manager of the Northampton Corporation Tramways, at a salary of £300 per annum, rising on approved service by two annual increments of £25 each to a maximum of £350. Mr. Cameron was formerly electrical engineer to the undertaking, but was appointed temporary manager six months ago following upon the dismissal, with £300 compensation, of the late manager, Mr. J. Gottschalk, who was of German birth. At Monday's Mr. J. Gottschalk, who was of German birth. At Monday's meeting of the Town Council one member protested against the dishonourable way in which the Council was acting towards the late manager. He stated that it was held out to him that he would be able to apply for his old position after the war.

Mr. G. H. Margraye, chief clerk in the Northampton Corporation Tramways office, has resigned upon being appointed manager of the Wolverton Steam Tramway. Mr. H. W. Sykes has been appointed chief clerk and Mr. I. J. Gee second clerk at Northampton

Northampton.

The salary of Mr. F. Buckley, the Wigan Corporation tramways manager, has been increased from £225 to £275 per annum, with a further advance next year to £300.

Mr. J. C. Whiteley, assistant manager and engineer to the Chatham and District Light Railways, has been appointed tramway manager by South Shields Corporation.

Mr. SAUNDERS acting manager of the Daylford tramways manager was acting manager of the Daylford tramways manager.

MR. SAUNDERS, acting manager of the Dartford tramways, met with a motor accident last week, and sustained, amongst other

injuries, a fractured collar bone.

injuries, a fractured collar bone.

Consequent upon the deaths of Mr. W. C. Gordon, manager, and Mr. R. S. Treeilian, secretary, of the Dublin United Tramways Co., the directors have appointed Mr. George Maeshall Harriss chief electrical engineer, as general manager. Mr. Taiman, a member of the electrical staff, has been appointed principal electrical engineer; and Mr. Brophy, who was principal assistant to Mr. Gordon, is appointed traffic manager. Mr. McHugh, chief accountant to the company, succeeds to the secretaryship, and his principal clerk, Mr. Rathbone, becomes chief accountant.

General.—We mentioned in our last issue the names of several gentlemen upon whom distinction had been conferred in the King's Birthday Honours' List which appeared just as we went to press last week. These should be supplemented by the following :

BARON READING is appointed a G.C.B. (additional), and BARON MOULTON a K.C.B. (additional) in the Civil Division, in recognition

of services during the war.

WILLIAM PETERSON, Esq., L.L.D., C.M.G., Principal and Vice-Chancellor of McGill University, Montreal, is appointed to the Most Distinguished Order of Saint Michael and Saint George.

MOST DISTINGUISHED OF OFF OF SAINT MICHAEI AND SAINT GEOFFE.

HUGH TROWBRIDGE KEELING, Esq., A.M.I.C.E., Chief Engineer and Secretary to the Chief Commissioner, Delhi, is appointed to the Most Exalted Order of the Star of India.

WILLIAM MAXWELL, Esq., C.I.E., M.V.O., Director-General of

Posts and Telegraphe, is appointed to the Most Eminent Order of

the Indian Empire.

ROBERT RICHARD GALES, Esq., A.M.I.C.E., Indian Public Works Department, Engineer-in-Chief, Hardinge Bridge, Sara, Bengal, receives the honour of Knighthood.

RAI CHUNILAL BASU BAHADUR, F.C.S., Teacher of Physics and

Chemistry, and Fellow of the Calcutts University, is appointed to the Imperial Service Order.

BICHABD JOSHUA KEYS, Esq., Indian Telegraph Department, Deputy Superintendent, Traffic, Simla, is appointed to the Imperial Service Order.

In the London Gazette list of recent appointments under the Civil Service Commission, the following notices appear:—

Admiralty.—First assistant electrical engineer, HARRY HEWLETT RICHARD GREEN.

Admiralty.—H.M. Dockyards and Naval Establishments: Electrical mains and distribution supervisor, Thomas Handel Cawthra; electrical station supervisor, H. W. G. J. Jackson.

MB. HOWAED EADY, telephone manager for the Jersey District, who is leaving to take charge of the Exeter District, has been presented by the staff with an inscribed silver salver.

The Salford Board of Guardians has decided that, in consideration of the extra amount of work devolving upon MR. Bostock, the engineer, and the able way in which he has carried out the work of relaying the electric cables between the administration block and

relaying the electric cables between the administration block and the schools, he be granted an honorarium of £10.

COUNCILLOR WHITESIDE has been elected chairman of the Stretford Electricity Committee for the ensuing year.

The Times states that Mr. J. G. B. STONE has been elected to fill a vacancy on the board of the Madras Electric Tramways (1904), Ltd., rendered vacant by the death of Mr. T. E. Ivens.

Mr. WILLIAM SMITH, who has been Controller of Telegraphs at the General Post Office, Edinburgh, since April, 1911, has retired from the service after 45 years' connection with it. He is an authority on high-speed telegraphy, and sat on several committees in connection with telegraph improvements.

Mr. SIDNEY FRANCIS SCHMID, electrician, of 30. Thorneycroft

MR. SIDNEY FRANCIS SCHMID, electrician, of 30, Thorneycroft Street, Birkenhead, announces that by deed poll he has assumed the surname of Smith. He is a natural born British subject.

Obituary.—Mr. R. W. SMITH SAVILLE.—The death occurred at Darwen on the 2nd inst. of Mr. R. W. Smith Saville, aged 47, who went to Darwen from Burton-on-Trent. He was aged 47, who went to Darwen from Burton-on-Trent. He was responsible for many important undertakings, notably the electrification of the tramways, the laying of the tramways to Hoddlesden, and the completion of the electricity works. Up to three years ago he was joint manager of the tramways.

The Times records the death of SIE ARTHUE TERDGOLD LAWSON.

chairman of the firm of Fairbairn, Lawson & Co., engineers, Leeda,

chairman of the firm of Fairbairn, Lawson & Co., engineers, Leeda, at the age of 71 years.

The death occurred at Bolton recently, of MR. Edwin WHITTAKER, who was at one time the superintendent of the Accrington tramways. He was with the Accrington tramway department during the time of the old steam locomotion, and for some time after the system was electrified.

The death has occurred in a Dublin hospital of MR. WALTER OBE MCILVEEN, chief clerk in the Belfast Corporation electricity department. Deceased was in his 39th year. He had been associated with the Belfast electricity undertaking for 20 years.

### NEW COMPANIES REGISTERED.

Nordisk Electrical Power Co., Ltd. (140,530).—This company was registered on June 2nd, with a capital of £10,000 in £10 shares, to develop water and other powers for the production of electric, pneumatic, hydraulic or other power or force, to transmit, distribute and supply the same throughout the United Kingdom, Northern Europe, and elsewhere. The subscribers (with one share each) are: W. A. Cox, 6, Solva Road, Winchmore Hill, N., secretary; E. Cant, 102, Maidstone Road, New Southgate, N., accountant, Private company. The first directors are not named. Registered office: 18, High Street, Holborn, W.C.

office: 18, High Street, Holborn, W.C.

Southdown Motor Services, Ltd. (140,534).—Registered June 2nd, by Jordan & Sons, Ltd., 116-17, Chancery Lane, W.C. Capital, £51,250 in 50.000 74 per cent. non-cum. part, prel. shares of £1 each, and 25,000 febred shares of 1s, each. Objects: to adopt an agreement with the Brightor, Hove & Preston United Omnibus Co., Ltd., Worthing Motor Services, Ltd. and the London & South Coast Haulage Co., Ltd., to acquire any tramway or light railway, and any trolley vehicle (being any mechanically-propelled vehicle adapted for use upon roads and moved by electrical power transmitted thereto from some external source), motor or other omnibus, ship, boat, aeroplane or airship, or motor or other cab undertakings in the United Kingdom or elsewhere. The signatories (with one preferred share each) are: W. F. French, 314, High Road, Balham, S.W., engineer; J. J. Clark, Goldstone House, Hove, director. Private company. The first directors (to number not less than two or more than seven) are Sir James Bradford, Kt., Alderman J. J. Clark, J.P., A E. Cannon, A. D. McKenzie, W. F. French, and W. S. Wreathall. Qualification, 100 shares. Remuneration, £50 each per annum (chairman £25 extra). Solicitors: E. M. Marx & Colbourne, 62, Old Steine, Brighton.

# OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Duram, Ltd.—Particulars of £20,000 debentures, created March 23rd, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £5,600. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Kingolite Co., Ltd.—Charge as additional security, dated May 14th, 1915. (supplemental to debenture dated July 9th, 1914, securing 400). Promity charged: certain royalties. Holder: E. D. Taylor, Estation Road, Stumford Brook, W.

Bournemouth and Poole Electricity Supply Co., Ltd. (55,189).—Capital, £500,000 in 25,000 ordinary, 7,500 4½ per cent. preference, and 17,500 6 per cent. 2nd preference shares of £10 each. Return dated April 181, 1915. 15,000 ordinary, 7,500 4½ per cent. preference, and 17,500 6 per cent. 2nd preference shares taken up. £10 per share called up on 15,000 ordinary, 7,500 4½ per cent. preference and 15,000 6 per cent. 2nd preference, and £6 per share on 2,500 6 per cent. 2nd preference (new issue). £390,000 paid. Mortages and charges: £187,500.

gages and charges: £187,500.

Madras Electric Tramways (1904), Ltd. (80,361).—
Capital, £900,000 in £5 shares (25,000 prcf.). Return dated April 6th, 1915.
20,000 preferred and 11,452 ordinary shares taken up; £5 per share called up on 13,500 preferred; £67,500 paid; £89,760 considered as paid on 6,500 preferred and 11,452 ordinary. Mortgages and charges: £59,540.

Eastern and South African Telegraph Co., Ltd. (13,306).—Capital, £600,000 in £10 shares. Return dated May 26th, 1915. All shares taken up; £600,000 paid. Mortgages and charges: Nil.

Rrompton and Kangington Electricity Supply Co.

Brompton and Kensington Electricity Supply Co., Ltd. (25,913).—Capital, £300,000 in £5 shares (20,000 pref.). Return dated April 1st, 1915. 6,007 preferred and 33,993 ordinary shares taken up; £5 per share called up on 6,007 preferred and 32,993 ordinary shares; £195,000 paid, £5,000 considered as paid on 1,000 ordinary shares. Mortgages and charges: Nil.

British Electric Transformer Co., Ltd. (76,351).—Capital, £200,000 in £1 shares (100,000 pref.). Return dated April 2nd, 1915. 61,988 preferred and 85,498 ordinary shares taken up; £1 per share called up on \$2,764 preferred and 9,529 ordinary shares, and 7s. 6d. per share on 14 ordinary; £62,298 5s. paid thereon; £15 12s. 6d. paid on 25 shares forfeited; £85,179 considered as paid on the remainder. Mortgages and charges: Nil.

Metropolitan Electric Supply Co., Ltd. (25,395).—Capital, £1,500,000 in 200,000 ordinary and 100,000 preferred shares of £5 each. Return dated March 30th, 1915. 200,000 ordinary and 76,121 preferred shares taken up. £5 per share called up on 195,936 ordinary and 76,121 preferred; £1.360,285 paid; £20,320 considered as paid on 4,064 ordinary. Mortgages and charges: £628,000.

British Insulated and Helsby Cables, Ltd. (52,285).—
Capital, £1,000,000 in 100,000 preferred and 100,000 ordinary shares of £5 each. Return dated April 5th, 1915. All shares taken up. £5 per share called up on 74,470 preferred and 40,665 ordinary; £372,675 paid; £427,325 considered as paid on 25,530 preferred and 59,935 ordinary. Mortgages and charges: £700,000.

Northwich Electric Supply Co., Ltd. (46,958).—Capital, £35,000 in 25,000 ordinary and 10,000 preferred shares of £1 each. Return dated April 14th, 1915. 5,000 preferred and 18,525 ordinary shares taken up; £23,525 paid. Mortgages and charges: £10,810 4 per cent. debentures (part of £11,000 authorised).

County of London Electric Supply Co., Ltd. (34,320).—
Capital, £1,600,000 in 80,000 preferred and 80,000 ordinary shares of £10 each.
Return dated March 29th, 1915. 65,000 preferred and 65,000 ordinary shares taken up; £1,300,000 paid. Mortgages and charges: £1,000,000.

### CITY NOTES.

### Shropshire, Worcestershire and Staffordshire Electric Power Co.

Electric Power (o.

Mr. W. L. Madgen, presiding at the annual meeting, held at Electrical Federation Building, W.C., on Monday, said that it was in 1914 that their electric supply business began to assume considerable dimensions. They were now supplying current for power, traction and lighting purposes in the boroughs of Smethwick and Dudley, also in the districts of Oldbury and Halesowen, while they held the principal share interest in the Kidderminster undertaking, which would, in due course, be connected up to the main system of supply. Their first main power station for the purposes of this supply was situated upon a suitable site on the canal at Smethwick, where they would have a plant capacity of 19,125 kW., including the extensions now approaching completion. The smaller generating stations at Dudley and Kidderminster were in a different category, and as developments required it, the smaller steam dynamos which they contained would be displaced by highefficiency turbine sets of ample capacity to utilise to the best advantage the capital represented by the boiler plant, buildings, etc. Expenditure upon land, buildings, machinery, etc., at the close of the past year stood at £398,560, including £180,991 expended during the year. Much of their capital expenditure during the construction period had, of course, not yet fructified, but the business they had done enabled them to recommend a dividend of 3 per cent. The policy of the company in consolidating the electric supply in the district under one management promoted cheap production, distribution and administration, and thus enabled business to be done upon satisfactory terms. They were provided with a plant capacity and mains sufficient for dealing with a considerable increase in business, and looked forward to continued improvements in their returns. The Treasury had granted authority to issue £150,000 of preference shares or debentures, and arrangements were now in progress for the issue of this capital.

Mr. C. Shurreff Hulton seconded the adoption of capital.

Mr. C. Shirreff Hilton seconded the adoption of the report, which was carried unanimously.

### Gravesend & Northfleet Electric Tramways, Ltd.

The annual meeting was held on Monday at Electrical Federation Offices, Kingsway, W.C. The report submitted showed that the revenue for 1914 was £20,807, as compared to £14,081, that the revenue for 1914 was £20,807, as compared to £14,081, the increase being due to development of motor-omnibus services. After deducting all expenses, including repairs and maintenance, £1.800 for debenture interest, setting aside £1,250 for renewals fund, £5.464 remains, plus £879 brought forward There is to be placed to reserve £1.004, to reduction of commission on shares and debenture issue account £1,500, and after paying a year's preference dividend on the 6 per cent. cumulative preference shares to December, 1908 (£2,400), £1,439 is to be carried forward. £7,912 has been expended on capital account during the year, chiefly for motor-omnibus business. The capital is to be reorganised and the arrears of preference dividend from 1909 to 1914 dealt with, in order to put the company upon a sound basis to facilitate the raising of funds to provide for additional motor-omnibus business. scheme was put before the annual meeting for cancelling the arrears of preference dividend and converting the holders' shares into an equal number of ordinary shares. In place of the late Mr. J. F. Albright, Mr. P. N. Gray has been elected a director. a director..

### United Electric Tramways of Monte Video, Ltd.

THE directors' report for the year to 31st March, 1915, gives the following results of the operation of the tramway system for the year to October 31st, 1914 (the fiscal year of the Uruguayan Co.):-

Gross receipts					1913-14. \$1,698.885		Decrease, \$56,687
Operating expenses	•••	•••	•••	•••	1,033,942	•••	11,999
Net receipts		•••	•••	•••	664,943	•••	44,688
At exchange of \$4.7 to Passengers carried	the £		•	•••	£141,477 43,862,849	•••	£9,508 759,841
Car miles run	•••	•••	•••	•••	7,399,283	•••	61,911
Percentage of operating	expenses	to gr	oss rec	eipts	60.86		Increase, 1,28

The falling off in traffics was due principally to financial stringency throughout the whole of South America, accentuated in the latter months of the year by the European conflict, and to an abnormal rainfall and bad weather conditions during practically the whole year. The services also suffered interruptions in consequence of the municipal repaying works which were in progressed during the greater transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the project and the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired transfer of the desired tr were in progress during the greater portion of the period under review. The effect of the adverse conditions will be felt most heavily during the year now current, the receipts for which show a continuous decline. Although all possible care has been taken to counteract the decrease in receipts, and important economies in operation have been effected, the persented of working expresses there are firstly as the present of working expresses there are firstly as the persent of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expresses the manufacture of working expres centage of working expenses shows a further slight increase. This is more than accounted for by special expenditure necessitated by storms and floods, increase in maintenance charges, Inis is more than accounted for by special expenditure necess, and discounting of nickel and silver currency. The construction and equipment of the two substations, referred to in previous reports, has been completed, and both stations are in operation, although the Diesel engines have not yet been taken over from the contractors. Owing to the high price of oil fuel, it has been decided for the present to operate the substations on Sundays and Feast days only, and in case of emergencies. The new Administration Office building having been completed, the officials and their respective staffs were installed there early in 1914. The amount receivable from La Sociedad Comercial de Montevideo in respect of revenue was £133,818. The profit and loss account for the year, after providing for administration expenses, and charging £48,850 for idebenture interest, shows a credit balance of £77,035, making, with £12,641 brought forward, £89,676. There had been set aside for redemption of debenture stock £3,370, for redemption of the preference and ordinary share capital £2,500, and for renewals and contingencies £25,000. After paying 6 per cent. on the preference shares and 4 per cent. on the ordinary, £12,973 is to be carried forward.

Annual meeting, June 14th.

### Annual meeting, June 14th.

### German South American Telegraph Co.

The report of the Deutsch-Sud-Amerikanische Telegraphen Gesellschaft, of Cologne, for 1914, states that an increase in traffic and a considerable augmentation in the receipts took traffic and a considerable augmentation in the receipts took place in the first seven months, as compared with the corresponding period of the previous year. On August 5th, the cable between Borkum and Teneriffe was interrupted by the English, and two days later the station at Lome had to cease working. Nevertheless, it was possible to maintain the connection between Monrovia and Duala via Lome until August 9th. During the night of November 21st—22nd the cable between Teneriffe and Monrovia was also cut, probably by a British ship, whilst the wireless station at Monrovia was closed on September 1st, at the request of the Liberian Government. According to the agreement with the banking group, which is closely associated with the company, the directors took over in the course of the year, at the price of £105,600, the shares held by the group in the Compania Telegráfico-Telefónica del Plata, of Buenos Aires. The Argentine company suffered in 1914 from the unfavourable economic conditions which prevailed in all South American countries, and which were aggravated by the outbreak of the war, and the accounts of this vailed in all South American countries, and which were aggravated by the outbreak of the war, and the accounts of this subsidiary company consequently closed with a slight loss for the year. The total receipts of the South American company, including the balance of £6.600 brought forward, amounted to £216,000, as contrasted with £219,000 in 1913. On the other hand, general expenses absorbed £44,900, as against £43,900, the cable renewal fund £15,600 as in 1913, the cable maintenance fund £30,300 as compared with £31,000, and depreciation £3,800 as against £7,600. The redemption of the cable network requires £11,300, as contrasted with £10,800, and the interest service on the loans of £1,046,000 needs a further sum of £47,000, as against £46,000 in 1913. As net profits, the accounts show the amount of £59,100, as against £62,600, and the dividend on the ordinary share capital of £625,000 becomes reduced from 64 per cent. in 1913 to 6 per cent, last year,

### American Westinghouse Co.

Bradstreet's states that while the annual report of the West-Bradstreet's states that while the annual report of the Westinghouse Electric & Manufacturing Co. for the fiscal year
ending March 31st, 1915, is silent on the point of the greatest
public interest concerning that organisation, to wit, the amount
and character of the orders for war material it has received
from European countries, it is, nevertheness, a document
which is entitled to attention. The income statement for the
year compares with the figures of the preceding fiscal period
as follows:—

as lulluns,—				
Year ending March 31st.		1914-15.		1913-14.
Gross sales	•••	\$33,671,485	•••	\$43,733,646

### Electrical Power Storage Co., Ltd.

The scheme for the amalgamation of the above company with Messrs. Pritchetts & Gold, Ltd., was approved at an extraordinary general meeting, held on June 3rd, at 4, Great Winchester Street, E.C. Mr. James Gray, who presided, first explained the reasons why the board had considered the proposal made by the firm mentioned. For some years the E.P.S. Co. had been seriously handicapped in London by rent, rates, and taxes, which were so much higher than in the provinces. During the last few years changes had been made in the management, and many economies effected, which had partly counteracted these drawbacks. Their principal drawback had been the lay-out and condition of their present works, which precluded the economical and rapid handling of goods necessary in these days of keen competition. They had come to the conclusion that the abandonment of the existing works was necessary, and negotiations for securing new works were proceeding when Mr. Pritchett approached the speaker with an amalgamation proposal. Messrs. Pritchetts & Gold could, at Feltham, provide accommodation for this company for a much lower outlay than they could have obtained new premises for themselves, and great economics could be effected by combining the two organisations. The larger shareholders had cordially approved of the provisional scheme for amalgamation, which was to take effect by the sale of substantially the whole of the property and assets of the company for shares and debentures of Pritchetts & Gold, Ltd. The company would retain its book debts and cash and discharge its liabilities. It would transfer to the amalgamated company (a) investments at market value; (b) its plant, tools and furniture, valued at the date of the agreement at £8,000; (c) its stock-in-trade upon terms: and (d) its patents, goodwill and benefit of contracts for £13,658. The purchase price would be satisfied by the issue of the following securities of the amalgamated company, viz.:—(a) £10,000 first mortgage debentures (part of an issue of £30,000) carrying i THE scheme for the amalgamation of the above company with viz.:—(a) £10,000 first mortgage debentures (part of an issue of £30,000) carrying interest at 5 per cent., payable half-yearly, and redeemable at par on June 30th, 1917, or at the option of the company, at any earlier date, with a premium of £5 per cent.; (b) 18,658 ordinary "B" shares of £1 each; (c) 4,000 deferred shares of 1s. each; and (d) preference shares or debentures for the balance. To carry the amalgamation into effect, it would be necessary for this company to go into voluntary liquidation, and the name of the amalgamated company would become "Pritchett & Gold and Electrical Power Storage Co... £4d." The purchase price to be paid by Pritvoluntary liquidation, and the name of the amalgamated company would become "Pritchett & Gold and Electrical Power Storage Co., Ltd." The purchase price to be paid by Pritchetts & Gold, Ltd., would enable the debenture holders of the E.P.S. Company to receive an exactly equivalent amount of debentures of the amalgamated company, viz., £10,000, bearing the same rate of interest and redeemable on the same date as their present debentures. It was anticipated also that the liquidators would be enabled to distribute to the shareholders one 10 per cent. non-cumulative "B" ordinary share of £1 of the amalgamated company for every ordinary or founder's

share of £5 of this company, and, in addition, one deferred share of 1s. of the amalgamated company, for every five ordinary or founders' shares of this company. The writing off of £4 per share was very drastic, but under the circumstances it was unavoidable. In the last balance sheet the item of patents and goodwill stood at £67,885, notwithstanding that the principal patents had long since expired. Moreover, a good deal of the plant and tools was now practically obsolete; in fact, they were valued at the date of the provisional agreement at £8,000. The capitalisation of Pritchetts & Gold, Ltd., was very conservative and having regard thereto, they considered the exchange offered to the shareholders of this company fair and reasonable. Indeed, they had in contemplation the writing down of the capital by £4 per share before this scheme of amalgamation was suggested, as it was quite apparent that no new capital could have been obtained for new works until this was done. The deferred shares of 1s. each were, so far as capital value was concerned, only nominal, but as they were entitled to the reversion of profits after paying dividends on the preference shares and the "A" and "B" ordinary shares, the deferred shares would, they expected, be of considerable value for dividend purposes. As indicated in the circular to the shareholders, however, a moiety of the dividend on the deferred shares to be issued to the shareholders. of considerable value for dividend purposes. As indicated in the circular to the shareholders, however, a moiety of the dividend on the deferred shares to be issued to the shareholders of this company would be deferred up to a maximum of £5,000 until all obligations under maintenance contracts of this company expiring before December 31st, 1919, were exhausted. A similar indemnity had been granted by Pritchetts & Gold, Ltd., against their maintenance contracts, the proportion of dividend to be withheld being reduced in proportion to the smaller number of contracts which they had running. In regard to the position of maintenance contracts, it would be realised that until a fund was built up to provide for these contracts no part of the current manufacturing profits would be available for distribution. Under the scheme of amalgamation it was anticipated that the dividend on the "B" ordinary shares would be earned without difficulty, and after the mation it was anticipated that the dividend on the "B" ordinary shares would be earned without difficulty, and after the indemnity of £5,000 against maintenance contracts had been provided there would be a very substantial dividend on the deferred shares, rendering these shares of real capital value. The necessary resolutions were seconded by Sir James Pender and carried unanimously, Messrs. James Gray and W. A. Reid being appointed liquidators.

Middleton Electric Traction Co., Ltd.—The total revenue for 1914 was £18,557 and the expenditure £16,966, inrevenue for 1914 was £18,557 and the expenditure £16,966, including £2,495 for debenture interest and £3,000 for renewals. After paying a dividend of 5 per cent, per annum on the cumulative preference shares for the half-year ended January, 1912, £649 is carried forward. Total capital expenditure, £160,045. Passengers carried, 2,958,738, as compared with 3,023,741 in 1913; average receipts per passenger 148d., as compared with 147d.; average working expenditure per passenger 86d., as compared with '92d. Proportion of expenses to receipts 59 per cent., as compared to 63 per cent. The annual meeting was held on Tuesday at Electrical Federation Offices, Kingsway, W.C.

Nairobi Electric Power and Lighting Co., Ltd.-Nairobi Electric Power and Lighting Co., Ltd.—It is announced that in consequence of the present irregularity and delays of mails from Nairobi, it will not be possible to present the accounts for 1914 until a later date. The Nairobi accounts are finally closed and printed, has not yet arrived. The directors have, however, declared a final interim dividend of 4 per cent. in respect of 1914 on both preference and ordinary shares, making 10 per cent. in all paid for the year. Special local conditions make it inadvisable for the board to declare an interim dividend for the half-year ending June 30th, 1915, payable promptly, and same will be deferred until the results of the half-year's working are known. are known_

Devonport and District Tramways Co.—The annual meeting was held on Monday at Electrical Federation Offices, Kingsway, W.C. The directors reported that an agreement had been entered into for the sale of the tramways to the Plymouth Corporation as on October 2nd, 1915. The balance on revenue account for 1914 amounted to £8,831, which is to be distributed amongst the shareholders pro rata to their holdings.

International Light and Power Co., Ltd. directors recommend a final dividend of 11 per cent., less British income-tax, on the preference shares for the final quarter ending June 30th, being 6 per cent. for the year.

Yorkshire (West Riding) Electric Tramways, Ltd. —An interim dividend of 3 per cent, (being at the rate of 6 per cent, per annum) on account of the dividend accound on the 6 per cent, cumulative preference shares is announced.

Stock Exchange Notice.—The Committee has ordered the following securities to be quoted in the Official List :-

Waygood Otis, Ltd.—Further issue of 15,000 ordinary shares of £1 each, fully paid, Nos. 135,001 to 150,000; and 15.000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 135,001 to 150,000.

Manila Electric Railroad and Lighting Corporation.—The directors announce a dividend of 11 per cent. for the quarter ending June 30th,

### New General Traction Co., Ltd.

New General Traction Co., Ltd.

The directors report that the revenue received and accrued during the year ended March 31st, 1915, amounted to £20,358. The general expenses, including directors' fees and legal charges, amounted to £1,893, and the debenture interest; less income tax, to £7,023. The profit was £11,059, plus £6,502 brought forward, making £17,561 available for distribution. The directors recommend a 4 per cent. dividend, absorbing £10,480, and £7,081 is to be carried forward. The accounts of the Norwich Electric Tramways Co. show that there was an increase in the traffic receipts for the year, but also an increase in the expenses. A dividend of 3 per cent. was paid by that company for the year ended June, 1914. The Douglas Southern Electric Tramways, Ltd., paid 1½ per cent. on its preference shares in respect of the year ended October, 1914. The outbreak of war was responsible for the great decrease in traffic receipts. The income received from the Philadelphia undertaking for the year ended December, 1914, amounted to £13,912.

Annual meeting, June 15th.

Barcelona Traction, Light and Power Co., Ltd.-At a meeting of 5 per cent. first mortgage bondholders, held in London on Tuesday, an agreement was approved for the creation and issue of 7 per cent. prior lien bonds and for modifying the terms of the trust deed.

### STOCKS AND SHARES.

TUESDAY EVENING.

THERE remains a general air of lassitude over prices, and

There remains a general air of lassitude over prices, and business does not give nuch indication of material improvement. At the same time, there is a little going on in some of the departments of the Stock Exchange, and a welcome recovery has occurred in the price of Brazilian Tractions. On the other hand, an outstanding feature is provided by a furthe slump in the Income bonds of the Electric Railways, and this has had the effect of depressing both classes of shares in the same company. Stock Exchange rumour insists that the passage of the Dardanelles has been already forced, but that the Admiralty prefer to keep silence on the point at present. The Rio de Janeiro rate of exchange has moved up sharply to 12 7/16d. after touching 1s. per milreis. That there should be some sort of reaction was natural enough, though it seemed so long in coming that people with Brazilian securities have been getting frightened, and it required but a small amount of pressure to sell for the price of Brazil Tractions to crumble noticeably. The price has been down to 494, but is now 4 points higher; and the rally in the exchange has revived hopes that the dividend may be maintained at its regular 6 per cent. level. Some people seem to think that it would not be at all a bad thing if the directors decided to lower the dividend, if only to save the quarterly uneasiness which worries shareholders when the date of dividend declaration draws near. Certainly there is ample excuse for the directors to plead prudence in reducing the dividend from its present comparatively high figure.

The further fall of 64 points in Underground Electric In-

prudence in reducing the dividend from its present comparatively high figure.

The further fall of 6½ points in Underground Electric Income bonds affects a wide circle of investors; and since there is no apparent reason for the drop, some of the holders are beginning to get more than a little anxious. It is fresh in the mind of everybody that Sir Edgar Speyer just lately resigned his position as chairman of the company, so, of course, the supposition is advanced that he may have been wishing to realise some of his bonds and shares. This is sheer guesswork, and we must admit that to us it sounds a little improbable, because, putting it on its lowest ground, Sir Edgar Speyer's firm is so intimately connected with the Underground Electric Railways Company that selling from his personal account would depreciate the firm's holdings—and, as we have predicted out before, the limited character of present-day markets renders them particularly susceptible to a mere modicum of buying or selling.

It is obvious enough that the London General Omnibus Company that be doing extremely well but the District Rail-

buying or selling.

It is obvious enough that the London General Omnibus Company must be doing extremely well, but the District Railway and other Tubes cannot be making much profit at present. With so little known data to work upon, it is difficult to form reliable opinions about the security of these particular bonds; but, having regard to the acute nature of the fall, and the fact that, so long as they get their full interest, the return on the money invested at the present price comes to nearly 10 per cent., making allowance for the fact that the coupons are paid free of tax, some sort of a recovery does seem likely to take place. to take place.

Notwithstanding the slightly dull tone which envelops investment markets, it is still none too easy to pick up stock in certain markets. We have referred over and over again to the difficulty that exists in obtaining good-class electrical issues, and, in view of this, it may be of some use to set out a selection of a few bonds and stocks which can be actually bought at the present time. Even in the following cases there are several in which the amount of stock on offer is limited to a few hundred pounds, but we submit them in order to

show the yields obtainable from securities on offer at the present time

The Electricity Supply list is disposed to droop, this applying both to the ordinary and the preference shares. City of Londons have given way to 134, a drop of 10s. Westminsters fell 5s., and so did Charing Cross. This, of course, is the season of the year in which illumination shares are completely out of favour; and the weakness is noticeable in gas stocks, just the same as in some of the electric light descriptions

pletely out of favour; and the weakness is noticeable in gas stocks, just the same as in some of the electric light descriptions.

(How bloodthirsty the ordinary pacific Englishman can become may be instanced by the remark of a member of the National Guard returning from trench-digging at the beginning of the week, when he said, as the train passed the power station of the Charing Cross Company, that if a Zeppelin were to aim at that and, missing it, to strike a prisoners' camp near by, he, for one, would shed no tears. But this, it must be added, was at the end of a very hot day; and the effect of trench work upon the temper during the weather experienced in the first part of the week, it were best left to the wives of some of us to describe.)

The Mexican group continues flat. Mexican Trams fell 3, the 6 per cent. bonds 2 points. Depreciation of the currency is the worst-feared result of the revolution. Germany seems to be marching much the same path as is Mexico in this matter, and neutral manufacturers are already declining German bills, insisting upon payment in gold. It is all very well for German financiers to clash the loud cymbals about the credit of their country, and so long as trade is confined purely to internal channels, the paper manufacturers can work day and night without the country feeling much damage. But when it comes to trying to pass this sorry stuff along to other nations, there will be a different tale to tell. And it is plain as a pike-staff that, when the day of reckoning arrives after the war, there will be literally hundreds of German houses go smash, for lack of gold, as distinct from paper money.

The Telegraph market is a little irregular. Great Northerns have again advanced, a rise of £2 taking the price to 3. Globes are unaffected by the declaration of a final dividend on the ordinary, bringing the total distribution for the year up to 6 per cent. the same as before. Marconis are decidedly better, on dividend anticipations, and American Marconis strengthened to half-a-guinea.

Lift Accident.—A Manchester Coroner's jury inquired on Friday last into the circumstances of the death of Mordecai Reynolds (14), who received fatal injuries in a lift accident at the premises of the Provincial Incandescent Fittings Co., where he was employed. It appeared from the evidence that the boy had been placing parcels in the lift, which was electrically-worked, and a warehouseman on the third floor heard a scream and aw the lift ascending empty. He went downstairs and found the boy in the well of the lift. The warehouseman thought that the boy must have slipped while putting the parcels into the lift and grasped the starting lever to save himself, or else his coat had caught the handle. The manager said the lift was not in constant nee, and anybody could use it, but he had instructed the deceased not to use it, and had reprimanded him three weeks before the verdict.

### IN FARMING.—II. **ELECTRICITY**

# FARMING SUPPLY AT HEREFORD.

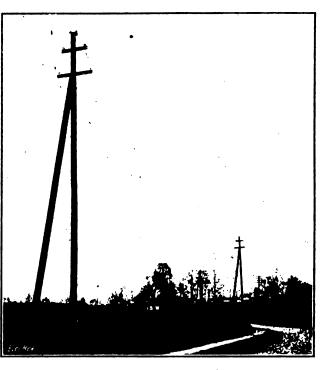

Ir convincing evidence as to the value of electricity in agriculture is to be put before our supply engineers—those who are in touch with farming districts—it will no doubt come better from within than without, and we are glad to be able to give some details of the work carried out by an English central station engineer, Mr. W. T. Kerr, of Hereford, in meeting the electrical requirements of the farmers in the vicinity of his city, and of the general supply

THE HEREFORD ELECTRICITY WORKS

in Hereford, which is a typical agricultural centre, in the hope that the excellent results obtained may be an incentive

In the first place, we may point out that the electricity works, which started in 1898-99, now contain some

Steam is supplied at 160 lb. pressure from one Stirling and two Lancashire boilers, which are fitted with Underfeed stokers, and provided with heated forced draught. The gases from the boilers are passed through an economiser,

TRANSMISSION LINE FOR FARM SUPPLY.

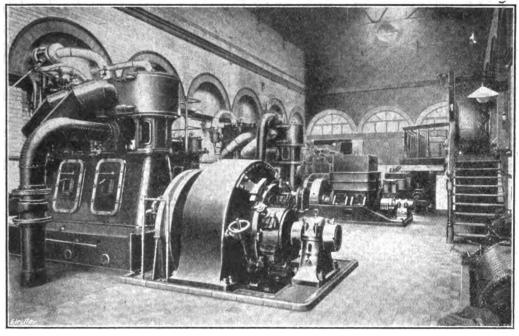

and both steam and electrically-driven feed pumps are installed. The presence of the older plant in the station has prevented the adoption of superheating up to now.

Through the electrical development of this agricultural

area, containing possibly 25,000 inhabitants, with, however, no factories, electric street lighting or tramways, over 1,300,000 units. were sold during the last 12 months, and a load factor of 25½ per cent. was obtained, figures which speak for themselves.

Under these conditions the generating plant operates on some 5 lb. of fuel (at a cost of 38d.) per unit, a mixture of slack and coke breeze being used at present owing to the coal crisis, and the overall steam consumption being, roughly, 30 lb. per unit.

The distributing network extends practically two miles out in every

STEAM GENERATING PLANT INSTALLED AT HEREFORD.

850 kw. of generating plant supplying a net area of seven square miles. This plant consists of Belliss-Dick Kerr and Belliss-Silvertown 500-volt generating sets—the most recent one a 300-kw. plant—with surface condensers working in conjunction with a Blasberg cooling tower and giving a 25-26 in. vacuum.

A 300 ampere-hour Chloride battery and balancer-booster are provided.

direction from the station, and while the built-up area is naturally supplied through underground cables, it has, of course, been necessary to adopt overhead pole lines for supplying the farmer and other scattered consumers outside this area. For this purpose some three miles of overhead line has been constructed, with fairly light wooden poles carrying two stranded-aluminium conductors on the upper cross-arm, and two galvanised iron

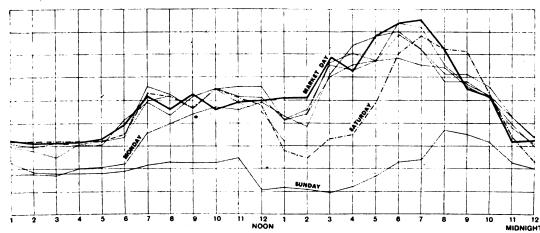

guard wires—which serve as the neutral wire—on the lower

At terminal poles adjoining the underground network the three-core armoured cable is carried to a dividing box at cows are kept. Here a  $7\frac{1}{2}$ -H.P. motor is, following a general practice, installed in a locked-up cupboard or cabin, and drives chaff-cutting, kibbling and pulping machines for preparing cattle food, and a small pump for supplying water;

electric light is installed in the byers, foal yards and house, about 30 metal lamps being used, including four 50-c.p. lamps in a bracket fitting for general yard lighting.

This consumer took 633 units last year for lighting, at 4½d. per unit, and 930 units for power, at 3d. per unit, less usual discounts, and gave the supply undertaking a revenue of over £23 for the year, and Mr. Kerr estimates the average farm bill in his area at £20 per annum.

It will be noted that

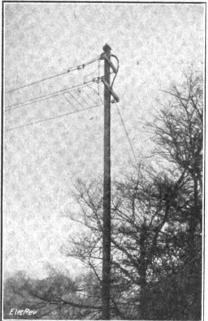

CURVES SHOWING VARYING DAILY LOAD FOR ONE WEEK; HEREFORD ELECTRICITY WORKS.

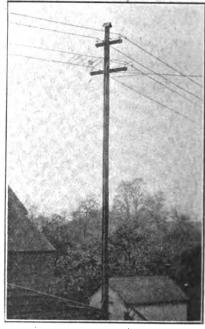

the top of the pole, the bare cable ends being joined to the overhead aluminium wires mechanically by means of Silvertown service joint connectors; at farm terminal poles Henley twin lead-covered wire, cleated to the pole and farm buildings, is used to couple the line and farm installation. Mr. Kerr gives the actual cost of such a line carrying two 7/10 stranded aluminium conductors and two guard-wires, erected in compliance with Board of Trade Regulations, as £110 per mile under normal conditions.

It is the practice to place such pole lines along the hedges where they are out of the way of cattle and field operations generally, and occasionally wayleaves for poles are demanded, of the order of 1s. per pole per year, where the owner of the land is not directly interested in the supply. So far, we gather that no maintenance has arisen on these lines, some of which have been in use for some years.

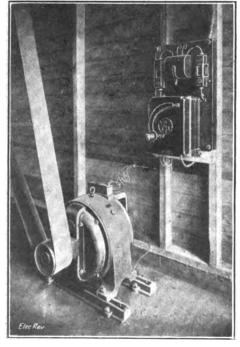

Mr. Kerr is at present supplying 10 actual farms, and we may refer to a typical case of one where from 80 to 100

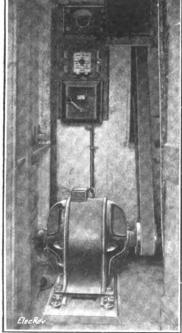

Underground Cable Terminal. Far
TERMINAL POLES ON FARM LINES,

Farm Terminal.

TYPICAL HEREFORD FARM MOTOR INSTALLATIONS, SHOWING STARTING SWITCHGEAR, &C.

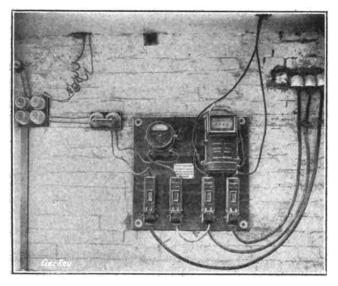

both the cost of overhead lines and the average revenue are higher than those indicated in the American figures, while the cost of energy is — allowing for American values — cheaper here, the results showing that the English farmer is likely to prove a better customer than the American.

Moreover, Mr. Kerr considers it quite feasible to obtain an average revenue of at least £200 per annum per mile of line from farms and country houses.

Such a line, 1,000 yards long, was recently constructed to supply a farm where power is used in the manner previously indicated, and for milking 88 cows, and the electrical stimulation of root crops, &c., as an experiment, on some 20 acres of land, during the early morning and evening is under consideration, by means of apparatus controlled through a time switch; this line has attracted two other farms and two private houses en route, and it is found that through the encouraging results every farmer will do all he can to get a supply, and if necessary use his influence with the local Councils, which

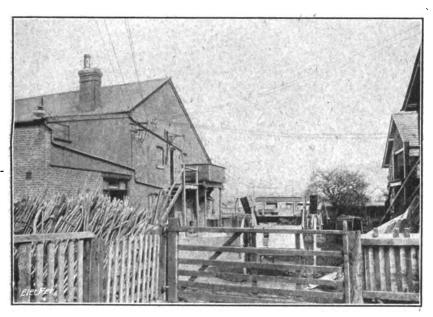

at first were strongly inclined to put difficulties in the way—following time-honoured precedents.

Such prices as 6d. per unit for lighting and 3d. per unit for power are quite acceptable to the farmer in this area,

FARM TERMINAL BOARD AND INCOMING CABLES.

who gains in many ways by using electricity. Thus the first cost of his installation is probably not more than half

OVERHEAD WIRING AND LIGHTING IN A HEREFORD FARMYARD.

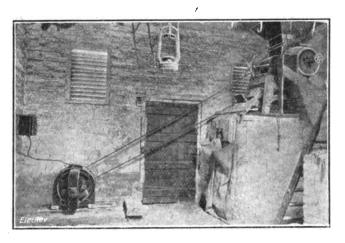

that for steam or oil power. His fire insurance is greatly reduced, especially where power is used in a stack yard, in which case insurance may be as costly as the power itself with a steam engine.

His labour costs less; the electric motor is always ready, and on a wet day, when outside labour is impossible, chaffcutting and corn kibbling can be done; moreover, milking machinery is being found essential. The freezing of water in the cylinder jackets or the necessity of emptying them is against the internal-combustion engine in the winter, while magneto and other starting arrangements are scarcely suited to farm usage, and it is not surprising that starting troubles are the bane of this type of prime mover on the farm.

As a sequel it may be mentioned that there are no petrol engines on farms in the vicinity of the Hereford distributing

To some extent recent legislation, in the shape of the Pure Milk Bill, has encouraged the use of electricity for lighting and power in cowhouses, which are being largely reconstructed in certain parts of the country, giving a convenient opportunity for installing electrically-driven food preparing machinery close to the cattle stalls, and of cutting fresh food every morning and afternoon of the week, when the cattle are fed, this having been found by experience to give an increased yield of milk.

Supply to an outlying farm is usually granted on a revenue guarantee of 10 per cent. of the cost of the line, and, in practice, amounts to from £7 to £8 per annum, which in view of the average farm bill for current

ELECTRICALLY-DEIVEN CORN KIBBLER, HEREFORD.

can be safely given by the consumer; speaking generally, one-third of the energy is required for lighting and two-

thirds for power. As previously indicated the electric motor has been very generally adopted in the old city itself, where we believe only a very few gas engines have survived its introduction.

Hereford is a centre of the cider industry and its five cider mills have some 300 H.P. of motors installed, the cellar lighting and refrigeration plants offering long-hour loads. Then there are three brewery consumers, one being electrically equipped throughout; five saw mills, a tannery and a tile works.

A particularly desirable consumer is a flour mill operating for 120 hours a week, with a 61-kw. average demand; electric ovens are used in this mill for both baking and moisture tests.

Two 60-H.P. electrically-driven turbine pumps—two 20-H.P. automatic pumps for high-pressure supply are also in use—at the waterworks provide an easily adaptable load and the saddlery, leather, hay and corn businesses associated with a country town have largely adopted small motors, so that in all over 2,000 H.P. of motors has

been installed, which consumed roughly a million units last year for industrial driving.

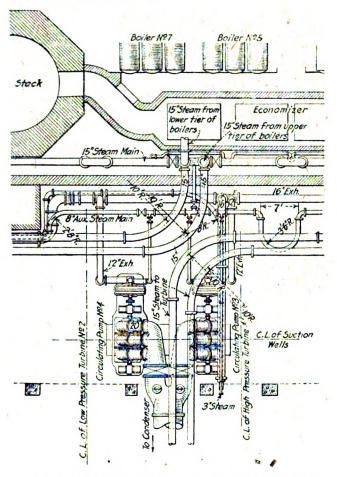

Copper.—Returns for May 31st, 1915, as set forth in Mesers, H. R. Merton & Co.'s statistical tables, again show an increase in visible supplies. The quantity, 34,090 tons, is 2,603 tons higher than for the end of April. English visible supplies have increased by the unusually large figure of 3,936 tons during the same period.

In detailed supplies a gratifying increase in European arrivals from North America is to be noted. This quantity, 31,085 tons, is only 3,315 tons under the average for the 12 months preceding August, 1914. Spain and Portugal exported to England and France during the month a quantity largely in excess of the pre-war average. Other countries (not specifically mentioned) contributed 8,166 tons, against a pre-war average of 4,910. Chile shipments are rather low for the month, but it must be remembered that they were high in April. Australian shipments are still a third below pre-war average. Total deliveries are 10 per cent, under pre-war average. The slowness with which the price has increased would appear to point to a fairly even balance between supplies and consumption.

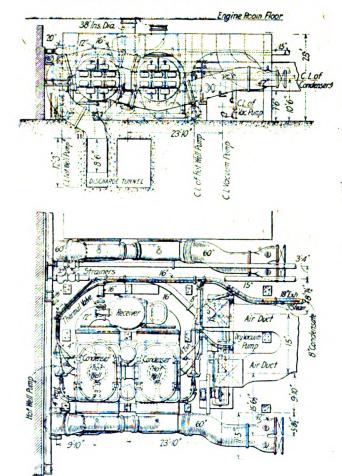

### THE NEW TURBINE PLANT OF THE INTERBOROUGH CO., NEW YORK.

AT the present time the reconstruction of the Seventy-Fourth Street station of the Interborough Rapid Transit Co., in New York, is being carried out with a view to meeting the increasing demand for power on the elevated lines.

CIRCULATING PUMPS AND PIPING, 30,000 KW. TURBINE.

This station, which was built in 1901—14 years ago—and excited considerable interest at the time, contained eight 12,000-H.P. Allis vertical-horizontal Corliss engines, driving 11,000-volt Westinghouse

revolving-field alternators at 75 B P.M., and having a steam consumption in recent times of 173 lb, per Kw.-hour.

Later on there was added a 7,500-kw. Westinghouse turbine unit.

Originally the engines were coupled to Worthington jet condensers, but in 1903 these were converted to barometric type condensers.

In the boiler house there were 64 Babcock boilers, each containing 5,200 sq. ft. of heating surface and six each of 6,000 sq. ft. heating surface; all were equipped with Roney stokers, and the gases were passed through Green economisers to four 278-ft. Custodis brick stacks. The generating plant operated on dry saturated steam at 160 lb. pressure, and with a vacuum of 26 in. The following remarks on the reasons for breaking up and replacing the engine units are quoted from Power:

units are quoted from Power:—

"The economy and the excellent physical condition of the units have caused many to wonder why low-pressure turbines were not connected to them, as practised with such satisfactory results at the company's Fifty-Ninth Street station. Briefly, the chief reasons are these: First, the economy of the turbine as a prime mover at the time of the Fifty-Ninth Street installation was not nearly as good as at present. Secondly, the engines at Fifty-Ninth Street, in addition to being in excellent physical condition, were designed for a higher pressure than those at Seventy-Fourth Street, and, quite important, they have poppet valves in the high-pressure cylinders, adapting them to high-pressure superheated pressure cylinders, adapting them to high-pressure superheated steam, while this advantage is not possessed by the Corliss-valve units at Seventy-Fourth Street. Thirdly, the complete expansion turbines (turbine and generator combined) now going in at Seventy-Fourth Street were bought at a comparatively low figure

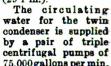

Seventy-Fourth Street were bought at a comparatively low figure—about one-third the price per kilowatt paid for the engine unite. Fourthly, it is necessary to economise on space at Seventy-Fourth Street, and complete expansion turbines accomplish this far better than combination units."

The reconstruction will involve the installation ultimately of eight 30,000-kw. turbine units, but at present three of these sets are being substituted for four 12,000-H.P. (7,500-kw.) engine units, leaving four engine units and the 7,500-kw. turbine unit of the original plant; for one-half of the boiler plant opposite the turbines, the Roney stokers are being replaced by Taylor underfeed stokers, superheaters are being added and the economisers removed; turbine-driven feed pumps are also in part replacing motor-driven pumps and the main switchgear is being rearranged and reactances added.

motor-driven pumps and the main switchgear is being realizable and reactances added.

The new turbine units each consist of two separate turbo-alternator sets side by side; one, the high-pressure set, consists of a single-flow turbine running at 1,500 R.P.M., while the other, the low-pressure set, consists of a double-flow machine running at 750 R.P.M. The turbines are of the reaction type throughout and are coupled through a large steam receiver. The arrangement was chosen to simplify design problems, particularly those relating to temperature range, blade speeds and steam congestion. The reliability of smaller units is also secured. Each complete unit rests on a steel frame foundation encased in concrete, leaving a good deal of spice below for condensing plant, &c. A twin-shell Worthington surface condenser is placed under the turbine unit,

under the turbine unit, hung from the turbine bedplates, but with the weight carried on springs. One shell is connected to each lowpressure exhaust outlet; the total tube surface is 50,000 Eq. ft., and the condenser is designed to deal with 350,000 lb. of steam an hour with water at 60° F., maintaining avacuum of 97 per cent. (29°1 in.).

CONDENSING PLANT ARRANGEMENT, 30,000-kw. Turbine.

capacity, which deliver to the two shells in parallel through a 60-in capacity, which deriver to the two shells in parallel through a so-inpipe, the water being drawn through a revolving screen at the
entrance to the inlet tunnel from the river. Each pump is driven
by a 240 H.P. turbine, and one pump unit will carry the winter load.

The twin condensers are rigidly bolted to the turbine exhaust

flanges, and a 36-in. equalising connection with a copper expansion joint is provided between the two shells, and in order to allow freedom of movement of the latter, the water pipe connections are made with rubber expansion joints. The condensate pumps for each unit are turbine-driven centrifugals of 800 gallons a minute-capacity each, one pump being spare. Two cross-connected recicapacity each, one pump being spare. Two cross-connected reciprocating air pumps are provided for the twin condenser, one being sufficient for the complete unit.

The pipe arrangement provides for delivering the condensate and auxiliary exhausts to a Hoppes open-type feed water heater; the receivers and the latter are also coupled through a heatbalance valve, the function of which is to interchange steam between the two according to which has the higher pressure.

At about 27,000 kw. the receiver reaches atmospheric pressure

and at 32,000 kW. it is at about 3 lb. gauge pressure and at 32,000 kW. it is at about 3 lb. gauge pressure.

The feed heater, to which reference has been made, is 9 ft. diameter and 21 ft. long, with a capacity of 1,600,000 lb. per hour; it contains 240 pans, each 4 ft. long, having a total area of 3 400 sq. ft.

The heater was installed partly because certain economisers had an removed to increase the effective flue area and partly owing

been removed to increase the effective fide area and partly owing to the good supply of exhaust steam from auxiliaries.

Turning to the boiler plant, which has been operated at 160 lb. pressure, although designed for 212 lb. with a factor of safety of 5, one half the boilers are now to be operated at 215 lb. pressure, 200° superheat, and the necessary alterations to fittings are being made, superheaters added, &c. Taylor underfeed stokers are being installed in place of the old ones, it being calculated that while under the old engine conditions a maximum of 1,150 kW. per stoker was obtainable under the new turbing conditions 3.750 kW. stoker was obtainable, under the new turbine conditions 3,750 KW.

will be satisfactorily carried.

Thus under the old conditions eight boilers were allowed for one 7,500-kw. unit, while the same number under the new conditions will be allowed for each 30,000-kw. unit.

In the boiler basement four triplex feed pumps have been

# LOAD FACTOR, OUTPUT AND COST.

### BY C. ASHMORE BAKER, A.M.I.E.E.

(Concluded from page 810.)

ATTENTION is called to the following typographical errors in the preceding portion of this article (Elec. Rev., June 4th, p. 808):— The equation for  $\rho$  immediately before equation (6) should be  $\rho=11^\circ8/\lambda^{0.981}$ ; that is to say, the value 0.831 is an exponent, and not a multiplier. Similarly in equation (9) the value 1.027 is

an exponent.

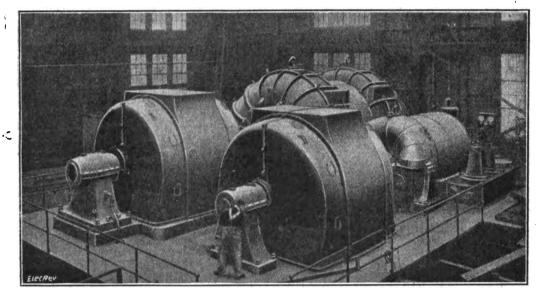

In the paragraph following equation (9) the dotted curve referred to is in fig. 1, not in fig. 3.

In fig. 12 capital expenditure is dealt with. The logarithmic diagram in the right-hand top corner represents the entire list of 200 municipal undertakings in London and the provinces, with which we are dealing, and connects total capital and maximum load. The curves in the main diagram represent capital ex-

penditure per kilowatt of maximum load for the various classes of under-

takings. With the exception of the London group, whose capital per kilowatt stands high almost throughout, high almost throughout, the curves are not very divergent, and there is a good deal of interlacing; thus the ordinary provin-cial town curve starting highest crosses all the others before the 4,000-kw. point is reached, while that for the coal area towns starting lowest finishes well above the general average, and some 25 per cent, above the ordinary provincial towns.

A noticeable feature of the general form of these curves is their tendency to flatten out above the 5,000-KW. point, owing pro-bably to the fact that the lower cost per kilowatt of large generating sets is counterbalanced by the

TURBINE SET OF 30,000 KW., SEVENTY-FOURTH STREET STATION, NEW YORK.

removed, and three turbine-driven centrifugal pumps, sufficient for the entire plant, installed; for each pair of boilers there is one turbine driving two stoker fans direct and the stokers also through helical reduction gears from the blower shafts.

The electrical switching arrangements have also been reconstructed to provide against the large amounts of energy which will now be concentrated on short circuit.

Between the generator and main bus-bars there is a 5 per cent. reactance, and between it and the auxiliary bus-bars is a 2 per cent. reactance.

The main bars are sectionalised through oil switches and groups of feeders run from each section. The 5 per cent. reactance coil is about 8 ft. 6 in. long, and the 2 per cent. coil 3 ft. 6 in. long, both being 4 ft. 6 in. diameter.

The generators, which are ventilated by rotor fans, the air being discharged into the boiler house, have about 8 per cent.

The steam consumption curve for the new units is a flat one, falling from 12.07 lb. per kw.-hour at 15,000 kw., to 11.27 lb. at 25,000 kw. (apparently the most economical load), and then rising to 11.63 lb. at 30,000 kw.

The steam consumption of the auxiliaries at the most economical

load is 7'5 per cent, of the main turbine steam consumption, and 6 per cent at full load.

The power consumption of the auxiliaries is 1'4 per cent. of the

main turbine power at full load.

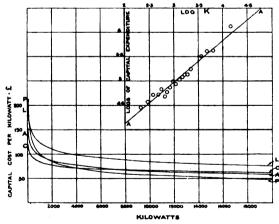

For the above particulars we are indebted to our American contemporaries, Power and the Electrical World, and to the latter for OUT VIEWS

Cinematograph Exhibitors' Association.—The annual conference of the Cinematograph Exhibitors' Association of Great Britain and Ireland (Ltd.), has been held in Edinburgh. Following the meeting of the Association, which was held in private, a luncheon was given, presided over by Mr. R. C. Buchanan, president of the Edinburgh branch. Various speakers paid a tribute to the cinematograph industry's work on behalf of recruiting, while it was pointed out that there are at present 67,000 theatres in the country, and that the Association represented 2,000, with probably an average capital of £5,000.

higher cost per kilowatt of extended supply areas.

INFLUENCE OF OWNERSHIP.

We now come to that highly controversial subject, the question of ownership, and I offer no applogy for presenting this aspect of the question to the readers of this journal, believing, as I do, that the science of political economy is as much the province of the

MUNICIPALITIES CAPITAL EXPENDITURE

A.A - ALL MUNICIPALITIES L.L - LONDON -

LONDON = MUNICIPALITIES IN COAL AREAS GROWINGIAL MUNICIPALITIES EX COAL AREAS

Fig. 12.

engineer as any other science; indeed, when we consider how inextricably finance is interwoven with engineering, it is safe to say that it is even more our province than many branches of even

physical solence.

The question presents itself to me in the following form:—
Under which of the two systems of ownership, public or private, can we produce and sell the largest number of units at the lowest average cost?

In asking ourselves this question, and endeavouring to solve it by applying the methods I have described, we must bear in mind

that our comparison must take into account not only the elements of size and load factor, but we must also compare our two types of ownership class by class. I have, therefore, divided the company-owned undertakings into three classes corresponding with those

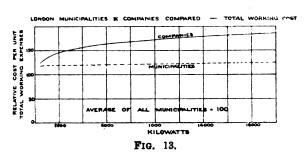

into which the municipalities have been separated.*

Having calculated the  $\kappa$   $\lambda$  diagrams for each group in the usual way (see fig. 9) I have worked out the cost curve corresponding with this  $\kappa$   $\lambda$  diagram under each heading from the standard equations. Taking the values of this curve at all points at 100, I have worked out the ratios thereto of the costs for corresponding values of K for the two types of undertaking in the group to be studied.

Thus curve B, fig. 9, gives us the relation between load factor and maximum load for London undertakings owned by municipalities. If we work out from these co-ordinate values of K and  $\lambda$  a corresponding curve for total cost from the equation the data of which are given in Table I E, and divide the ordinates of fig. 10 (full line) by the ordinates of our new curve, we shall obtain a series of values giving us the dotted line in fig. 13.

This is a curve of recontages and represents the amount per

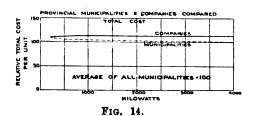

This is a curve of percentages and represents the amount per cent, by which the total cost per unit in the case of London

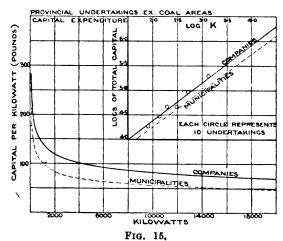

municipal undertakings exceeds the general average cost per unit incurred by municipalities as a whole.

The full line curve in fig. 13 is calculated in the same manner

The full line curve in fig. 13 is calculated in the same manner so that we are comparing companies and municipalities class for class, size for size, and load factor for load factor. Now let us look at the result. Dealing first with the provincial undertakings and taking the working expenses item by item. in some the Local Authorities show better results, and in others the contrary is the case. Thus on the items Oil, Waste and Stores, Wages of Workmen, and Rent, Rates and Taxes, the municipal figures are higher, but in the items for Fuel, Repairs and Maintenance, and Management, the companies' figures are higher

(for Management in particular, considerably higher) than the municipal figures, the general result being that the total cost to the companies is some 7½ per cent, higher than that for municipalities. (See fig. 14.) This result is naturally reflected in the price charged.

Turning to the London companies, there is not a single item, from the coal to the consumer, in which the companies' curve is not above, and considerably above, the municipal curve, the result

being that the consumer pays to the company something over 20 per cent. more for his energy than he would pay to a municipality. It should be noted, however, that load factor is an inverse function of the price charged, as will be seen later, and it is a question, therefore, if we are quite justified in basing our comparison on equal load factors; we should, I think, be quite justified in basing it simply on equal outputs were we considering the matter from the consumer's point of view. In such a comparison the municipalities would show to greater advantage still.

Figs. 15 and 16 show the capital expenditures of the provincial and London companies respectively, and in dotted lines the corre-

and London companies respectively, and in dotted lines the corresponding municipal capital expenditures. And here I must confess to an unpardonable crime against statistical ethics. Fig. 16 has been deliberately "faked."

In this figure each circle represents a single undertaking instead

of a group, hence they are somewhat scattered.

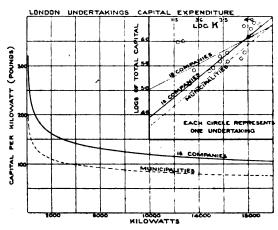

Fig. 16.

Now, if we take the whole 18 companies within the boundaries of Greater London, given in the returns which we are studying, we get a logarithmic diagram represented by the thin full line. We get a logarithmic diagram represented by the thin full line.

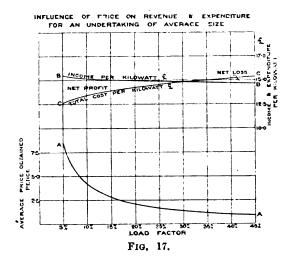

If, however, we eliminate the two undertakings represented by the two circles near the top left-hand corner of the inset, and calculate our average from the remaining 16 concerns, we shall get the thick full line, which it will be noted is fairly parallel with the dotted municipal line. The thick black curve is calculated from the "faked" thick black line, and that is my offence.

The difference between the black and dotted lines represents, I

Thus we have an answer to the question formulated above as to the most economical type of ownership; namely, that neither economy of first cost nor economy of administration or working is to be gained by private ownership.

Now if we look at fig. 17, we shall get an idea of how the ques

tion affects the consumer.

Curve A shows the relation between price and load factor for an undertaking of average size as derived from equation (8 and 9).

Curve B is the income per kilowatt obtained by multiplying the corresponding values of A by the load factor and by 87.6/240.

Note that this curve descends as the load factor increases.

Curve C is the total annual cost per kilowatt, and is arrived at by multiplying the values obtained from equation (6) by 87 6/240, and adding to the product a sum of £6 6s., being 7½ per cent. capital charges on an expenditure of £88 per kilowatt.

Note that this curve is an ascending curve, and that the vertical distance between B and C represents net profit as far as the point at which they cross. The distance separating them beyond this point would be net loss.

Now observe the difference in policy as between company and municipality, which these curves suggest. The object of the company is to keep net profits as high as possible, hence it has no interest in aiming at high load factors unless it can obtain

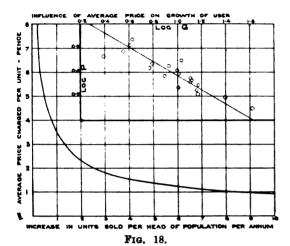

As there are only some half-dozen companies working in the coal areas, some of whose costs are above, and some below, the municipal average, I have neglected this class as offering no evidence either way.

exceptionally high relative prices; the trend of its policy is to keep prices up, as, in fact, the companies as a rule have done.

The object of the municipality, on the other hand, is to sell as many units as possible at the lowest price compatible with financial stability. (I am speaking now, of course, of the more enlightened municipalities.) The municipal engineer, therefore, is continually working towards the crossing point of the curves and endeavouring to push that crossing point as far as possible to the right by lowering his working expenses, and increasing his load (compare fig. 7). The consumers respond by buying 40 per cent. or 50 per cent. more units per head of population where Local Authorities own the supply than they do in areas supplied by companies.

Fig. 18 gives us the relation between average price charged and the growth of sales in units per head of population per annum. It is taken over a period of five years, and inasmuch as the equation to this curve is practically the same for both companies and municipalities, it may be taken as being independent of ownership.

cipalities, it may be taken as being independent of ownership.

When we consider that the average cost of a municipally supplied unit was, for the year 1911-12, 1.62d, as compared with 2.37d, charged by the companies, the sociological value of public owner-

ship becomes apparent.

Thus it is difficult to discover (outside the pockets of share-holders and directors) any justification for the general principle of

the supply of electricity by private enterprise.

There are many questions of great interest which the methods of analysis and comparison, which have been described, would elucidate. Such questions are bulk supply, group ownership of undertakings, the relative economy of different types of plant, questions of tariff, &c., and the author trusts that the foregoing suggestions, which do not pretend to be more than a rough preliminary study of methods, may produce results of greater value from the hands of specialists.

### CORRESPONDENCE.

eceived by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

### Munitions of War.

In this time of National stress I suggest the immediate organisa tion of the workshops of the many electricity supply works in the Kingdom, both municipal and company owned, with a view to producing shells and other suitable munitions of war.

I suppose all these works have already lost some men to the

Colours, but in every case they are compelled to retain enough men to deal effectively with any case of emergency that may arise in connection with these undertakings. These men could each do a certain amount of overtime for the good of the Empire. Moreover, they are for the most part skilled mechanics, and doubtless the Corporations and companies concerned would readily grant them the full use of their machine tools and workshops.

Possibly also additional service could be obtained from engineers

resident in the towns or districts where the works are situated, and thus the plant could be maintained on practically continuous duty excepting when required for the pressing needs of the power

station itself.

In this way a considerable source of production will be immediately tapped which otherwise must apparently remain dormant. Presumably the scheme would be worked in conjunction with the various munition committees which are being formed in the manufacturing centres. I feel sure the authorities would find both the managers and man of the electric power stations willing and managers and men of the electric power stations willing and anxious to do all they can to help the common cause on such reasonable terms as the Government are in a position to offer.

Geo. Wilkinson.

Electricity Department, Harrogate, June 5th, 1915.

### Automatic-Lift Accidents.

May we add a note on this subject endorsing Mr. Bosenbusch's suggestion that Mr. Broadbent, while justifiably criticising a lock of the type he illustrates, overlocks the qualities of other locks

of the type he illustrates, overlooks the qualities of other locks which have been available for many years.

It is, for instance, a very considerable period since we first sent out a lock which was free from all the defects enumerated by Mr. Broadbent, and in its present form it not only meets all the requirements laid down by Mr. Rosenbusch, but also another which in our view is a vital one, viz., that it shall be absolutely impossible to unlatch the gate without first cutting off current.

Mr. Butler asks for evidence as to the maintenance of an arc after an electric lock contact is broken. The writer has seen this on very many occasions, and holds the belief that under certain conditions it is possible in most of the locks in use. The conditions arise most frequently in automatic machines, but the arc can be

arise most frequently in automatic machines, but the arc can be obtained sometimes with car switch control.

It would only be mischievous to describe the conditions, but the

-increase the length of break.

That of course means an increased length of stroke for all moving parts and a larger box, with cost in proportion. The chief difficulty in the way is the reluctance of our good friend the architect to provide the requisite space, or to have beautiful doors and enclosures disfigured by "those barbarous engineering fellows." So small boxes with short breaks are the rule.

An evil influence in automatic lift switch design is how of the

An evil influence in automatic-lift switch design is born of the An evil influence in automatic-lift switch design is born of the fact that in most control systems several switches are intended to make circuit only, and never to break it. Therefore, it is argued, short breaks will suffice, and that will out down cost. But things do not always run as intended, and owing to some failure at a quite different point, due to dirt or bad lubrication, a poor innocent little "making" switch is called upon to break a comparatively heavy circuit, and trouble results.

In view of this contingency we have recently redesigned all our

In view of this contingency we have recently redesigned all our switches for every class of service, giving every switch a "breaking" capacity equal to the maximum current passing. We have suppressed the purely "making" switch.

Smith, Major & Stevens, Ltd. C. G. MAJOB, Chairman,

Northampton, June 3rd, 1915.

### Cable Shortage.

I was much interested in reading in your issue of May 28th the letter from a contractor re above. My firm has had the same experience with wire supplied by one of the oldest English cable manufacturers, the deficient coil being 15 ft. short of the six switch wires our man should have got out of a full coil. The fact switch wires our man should have got out of a full coil. The fact of finding one coil over the proper length does not remove the doubt in the contractor's mind as to whether he has been, and ir, getting what he pays for; when one finds such errors with firms of high standing, it lessens the desire to deal with them.

Your correspondent, in finding a coil 5 yards too long, was more fortunate than we were; we measured three new coils in the presence of the local agent, and found only one to be correct length, viz., 110 yards, the other two coils being 4 ft. and 4 ft. 4 in. short respectively.

Perhaps if others would tell their experience in this direction, it might lead to the contractors getting full measure in future.

I need hardly point out that these deficiencies, small in themselves, mean an enormous saving of material to the larger manu-

selves, mean an enormous saving of material to the larger manufacturers, increasing their dividends at the expense of the contractor, who has quite enough to look after, without measuring each coil of cable from the manufacturers.

A.M.I.E.E.

### Appointments Vacant.

At the present time, when employers are asking for Associates of the Electrical Engineers Institution at labourers' wages, it would save the time of those looking for responsible posts to separate such vacancies below £2 per week from those up to £5. Those above that figure (when they occur) could be placed first to show budding youths what might happen to them.

I also suggest a home for those too old at 30, as that appears to be the age limit for most of the advertised posts.

In a Good Post.

### Cab Signalling.

So far as Mr. Hans von Kramer's argumentum ad hominem is concerned, I surrender to him without offering so much resistance as a scratch of the pen. He has my unqualified permission to say that I cannot distinguish between Hertzian radiation and Faradic that I cannot distinguish between Hertzian radiation and Faradic induction; that I know nothing (and think less) of the Railophone; and that I do not know the difference between the mantissa of a Naperian logarithm and the n-th differential coefficient of a trigonometric function. Of one thing only do I solemnly warn him: viz., that he will find it a far more stupendous task to enumerate my intellectual deficiencies than to tabulate the real merits of the Bailophone, after the latter have been discovered.

I have spent many a weary hour calculating curves, frogs, and switches over which, for several years, trains have been running. I am, therefore, dimly conscious of the millions of times per month trains run over switch rails which, because they must be movable, cannot be fastened at the ends so easily as ramps can. The danger Mr. von Kramer mentions of a ramp being torn up is of the same kind as, and of no greater degree than, the danger to

a switch rail. When one reflects that the accidental tearing up of switch rails, by objects wrongly hanging down from trains, does not occur as often as one time in a year, one can see how much practical importance attaches to the solitary exception which Mr. von Kramer cites.

I think that some rather authentic Railophone information may be obtained from British patent specification 19,467 of 1912 (of which, no doubt, I am profoundly ignorant), since that specification bears the name of Mr. Hans von Kramer. By examining fig. 2 of this specification, a nasty man like me might suspect:—

(1) That any line-wire portion 3A would produce inductive effects towards the line of corresponding signals C as readily as the parallel portion of co-operating local loop y does; (2) that this same criticism applies in the opposite direction; and (3) that these wires produce such effects quite as energetically outwards from the track which they are intended to govern as they do either inwardly towards the centre line of that track or directly upwards.

By regarding the two tracks of this figure as the inner two of a

By regarding the two tracks of this figure as the inner two of a four-track route, we at once see that each line-wire will emit inductive impulses as readily towards the wrong (adjacent outer) track as towards the right track. Indeed, in the more recently published descriptions this short-distance radiation (how iconoclastic!) to the "other" track is actually employed, at the local loops on double-track routes, for effecting the danger warnings on

the trains.

It is in view of these facts that I shall be so happy when Mr. Acfield publishes the circuit diagrams and general descriptions (without taking the trouble to give details) which will enlighten humanity by revealing the "right lines" on which the Railophone can rationally be applied in the case of a double-track junction with a four-track route.

Wm. H. Dammond.

Nottingham, June 7th, 1915.

Your correspondent, Mr. von Kramer, must have either a very low opinion of the mental calibre of your readers or a very slight regard for his own reputation for truthfulness. Otherwise, he would not have applied the expression "illogical outburst" to Mr. Dammond's pertinent and clearly reasoned letter; nor would he have written cheap nonsense to the effect that he (Mr. von Kramer) did not think that Mr. Dammond would know the difference between the Faradic and the Hertzian classes to the signals. Is Mr. von Kramer not aware that the very terminology, Hertzian and Faradic, as applied to wireless cab-signal classes, was signals. Is Mr. von Kramer not aware that the very terminology, Hertzian and Faradio, as applied to wireless cab-signal classes, was introduced by Mr. Dammond? During the 20 months that Mr. Dammond's full-size tests—real tests—were taking place, more than a dozen persons spent a Saturday afternoon testing the mechanism, every person having had years of experience at electric light and power works, telephone or telegraph testing, or railway signalling. We were so surprised at the merits of the apparatus that we requested permission to return and bring others the next Saturday. Mr. Dammond replied that we were at liberty the next Saturday. Mr. Dammond replied that we were at liberty to bring anybody we wanted, and as many as cared to come. Not less than 30 came next time. On both occasions Mr. Dammond turned the whole installation over to us, instructing the driver to run the locomotive just as we dictated, and informing us that he hoped we would not heaitate to earth or break any wires, or other parts, as might be found necessary for thorough testing. From the experience gained on these two visits I know that in the Dammond

(a) Full protection is given against wrecks like Bromford Bridge and Tottenham Hale as well as Aisgill, because "stop" and "run slow" are both indicated audibly and visually, and in such a way that a driver or fireman always knows which is

intended for him.

(b) There is no danger of false clear signals being accidentally produced by induction or conduction from external electric

(c) No errors, except safe cones, can result from earthing or open-circuiting or botb.

(d) There is no danger or difficulty in the way of applying the

(d) There is no danger or difficulty in the way system to electrified railways.

If the Railophone fails with respect to any of these four specifications, it is inferior to the Dammond system. Will Mr. von Kramer permit a committee of trained men, including utter strangers to himself, to make the same searching tests of his Midland installation as we made of the Dammond equipment? Will Mr. Acfield and Mr. Sayers, of the Midland Railway, concur with Mr. von Kramer in granting this permission?

E. Sowberg.

Nottingham, June 7th, 1915.

### Overseas Trade-Nothing Done.

At the risk of being identified with the "I told you so" type At the risk of being identified with the "I told you so" type of adviser, I would like to point out in respect to your very appropriate comments on the efforts (?) of the I.E.E.-B.E.A.M.A. group, that the result is exactly as I have continually pointed out or foretold right away from your issue of September 11th last. All over the world I have nearly always found technical institutions and trade associations either "lame ducks" or professional muddlers of an advanced type.

As all electrical people are not tied to the I.E.E. or the B.E.A.M.A., why not commence an individual independent overseas trade campaign?

## BRITISH MANUFACTURERS AND THE CARRIAGE PROBLEM.

In view of the much discussed problem of the capturing of German trade and the cultivation of a higher standard of efficiency with which to combat the keener competition expected from Germany after the war, manufacturers and others interested in this question are regarding with no small concern the ever-increasing menace to trade caused by the carriage problem in this country at the present time.

At no period in the history of railways in this country do the interests of the trader appear to have received the careful attention they deserve. On the contrary, the attitude of the railway and shipping companies towards the development of trade has been for the most part selfish and antagonistic in effect. Whereas in Germany the question of freight charges is one of the minor considerations with manufacturers and others when quoting competitive prices, in this country it is one of the most important, and not infrequently the very item which precludes our successful competition in the open markets. It is no exaggeration to say that, taking a fairly general view of the carriage and freight rates in force in this country at normal times in comparison with those of Germany, the British manufacturer is saddled with an expense as much as 200 per cent. heavier all-round than that which his keenest competitor has to bear. While in normal times the rate for transport of cutlery from Sheffield to Hull has been 20s. per ton, in Germany it would work out at 6s. 7d. per ton. Similarly the charge for carrying hardware from Birmingham to Newcastle (207 miles) has been 25s. per ton; from Dortmund to Rotterdam (153 miles) it would be 10s. per ton. "One of the largest works in Germany. situated more than 150 miles from a shipping port, could reach Antwerp by rail for 3s. 6d. per ton of finished iron or steel. Similar products transported from works in the Midlands to London or Liverpool, equal distances, are charged about three times as much by the English railway

Nor is the position any better from the travellers' point of view. The railway contract charges in this country for commercial travellers, &c., are at all times a formidable item, and a direct discouragement to manufacturers and others to look after customers far afield by personal attentions. In Belgium a third-class season ticket available over 3,000 miles of railway for five days costs about 10s. 1d., and for a year £14 17s. 6d. The rate in this country over nearly all the leading railway companies' lines for similar distances would be at least three times that figure. One may travel long distances in Belgium for three or four days for considerably less than the cost of the journey from London to Dover and back. For less than 3d. a day a workman in Belgium can travel  $37\frac{1}{2}$  miles; a weekly ticket available for six return journeys of 20 km.  $(12\frac{1}{2} \text{ miles})$  costs 1.50 fr., slightly under 1s. 3d., or for 30 km.  $(18\frac{3}{4} \text{ miles})$  a weekly ticket costs 1.75 fr. (1s. 5d.). In Switzerland it is possible to costs 1.75 fr. (1s. 5d.). travel over the whole State system of railways for 45 days for £3 8s. Thus, in Switzerland, for 12 months' travelling available over 3,000 miles of railways, including lake steamers, the cost would be less than £27. In this country yearly third-class contract between Manchester and London alone is £55 5s.

The feature, however, that appears most inequitable of all is the preferential rates allowed by English shipping companies for goods exported, for instance, from Hamburg to New Zealand, with transhipment at London, a procedure which is cheaper than from London direct. "In Australia there is a widespread belief that German and American manufacturers are helped by lower rates than those obtained

by their British competitors." The explanation in the case of New Zealand is the desire of English shipowners to prevent the establishment of Continental lines to New Zealand, but the method adopted cannot commend itself to British manufacturers. In other instances there is not even this

explanation.

When it is considered that the British manufacturer has to contend against such serious disadvantages as these, harassed as he already is by stone-wall tariffs and unfair competition from within and without, it is hardly surprising that he sometimes becomes disheartened. The traditional high reputation of British manufactures all the world over has invariably been the chief selling point against the heaviest odds, but even this great asset cannot hold good for ever against the growing menaces from within as well as from without. Whereas in Germany, France, Switzerland, and practically all the chief European competitive countries, the railway and shipping systems are the auxiliaries and agents of trade, in this country they are the chief drawbacks to trade. One of the first reforms that ought to be insisted upon by British manufacturers and others after peace is restored is the settlement of this carriage problem, which promises, if allowed to continue to exist, to develop into nothing less than a grave injustice to the trading community.

The Mobilisation of Science.

Some weeks ago we hailed with pleasure and relief the announcement of the Government, that it had been decided to establish an Advisory Council on

Industrial Research, composed of scientific men, who should make it their business to develop and organise the scientific resources of this country, in preparation for the fierce and unscrupulous competition which may be expected from the Germans in the future. The new scheme was introduced in the House of Commons by Mr. J. A. Pease, the then President of the Board of Education, in an admirable speech, which indicated that he had fully grasped the needs and possibilities of the situation, and was anxious to put the work in hand at the earliest possible moment. No further information has been forthcoming, and since then, unfortunately, owing to the reconstruction of the Government, Mr. Pease has been replaced by a gentleman whose experience and knowledge of the subject cannot be compared We hope, however, that so excellent a proposal will not be allowed to drop or to be postponed, for some such movement is absolutely indispensable to our future welfare—the pity is that in spite of incessant adjurations the Government has hitherto turned a deaf ear to the demands of science for an opportunity to lead the way. Even if the scheme outlined by Mr. Pease is carried out, there is a great risk that the Government, strong in its ignorance of the scientific world, will nominate the wrong men for the work, and thus endanger the success of the new policy at the outset. We earnestly hope that the most expert advice will be obtained lest any such fatal error be

But it is not only in connection with industry that a scientific Council is required; an even more pressing need, if that be possible, is the organisation of science to aid in the prosecution of the war to a successful finish. Our enemies, who neglect nothing that will tell in their favour, have from the first-aye, and long before the outbreak of war-availed themselves of every device that science could evolve to assist them in the subjugation of Europe by fair means or foul, and their scientists have not shrunk from the base uses to which their knowledge has been prostituted. As Mr. H. G. Wells points out in a striking letter to the *Times* of Friday last, modern war—as conducted by Germany—is essentially a struggle of gear and invention. It is a war of surprises, which always emanate from our enemies and against which we have had to improvise means of defence too late to prevent terrible losses. For some of their foul measures, indeed, we have as yet developed no adequate counterstroke. "Throughout almost the entire range of our belligerent activities we are to this day being

conservative, imitative and amateurish when victory can fall only to the most vigorous employment of the best scientific knowledge of all conceivable needs and material." Mr. Wells calls for "an acting sub-Government of scientific and technically competent men for this highly specialised task."

The correspondence thus initiated has elicited a number of useful suggestions, such as the formation of Boards of Investigation and Experiment, which should consider ideas submitted to them and put to the test those which appeared to promise useful results; the offer of large money prizes for solutions to military problems; and the utilisation of the resources of our Universities for scientific investigations and tests. Dr. J. A. Fleming states that not only has no use been made of the knowledge and ability of scientific men, but even in some cases steps have been taken to inhibit their activities, as, for instance, in the field of electric waves. Since the war began hundreds of scientists and engineers have pressed their services upon the Government, without success, and young men of the greatest promise have enlisted and laid down their lives, whose expert knowledge and initiative would have been of immense value to their country, if properly utilised. It is even reported that when war broke out orders were given for all experimental work in naval and military departments to cease. We possess a magnificent asset in our scientific and technical experts, of which we have up to now made practically no use; yet there never was a time when their services were so urgently required by the nation. The Government, composed of lawyers and politicians, knows nothing of the nature and resources of science, and it is most necessary that every effort should be exerted to enlighten it and compel it to take immediate steps to organise this body of men who are burning to serve their country, and are, above all others, endowed with the knowledge and ability of which we stand in need, and without which we can hardly hope to bring this terrible war to a speedy and successful conclusion.

Professional Conduct.

Mr. Justice Neville, in the High Court of Justice, is of interest to all members of the great engineering institutions. As reported in the Times, the proceedings were taken by a member of the Institution of Civil Engineers, with a view to obtaining an injunction, pending the trial of the action, to restrain the Council from expelling the plaintiff from the Institution. The Council had drawn the attention of the plaintiff to certain alleged infractions of the rules of the Institution.

A CASE which recently came before

with regard to professional conduct, particularly in connection with the publication of an advertisement by the plaintiff's firm, and, after much correspondence, informed him that he had not discharged the onus of showing that he did not know, or approve, of the advertisement, wherefore he had been guilty of a breach of the regulations, and his name would be erased from the register of membership. The plaintiff at once took legal proceedings against the Council, and applied for an interim injunction, but Mr. Justice Neville, while expressing no opinion as to what the trial of the action might disclose, decided that there was no

irregularity in the judicial proceedings of the Council, and refused to make an order.

We have, of course, nothing to say at this stage with regard to the merits of the case, but we welcome the action of the Council in so far as it demonstrates that, recognising the futility of ponderous threats, it has at last decided to take effective proceedings against recalcitrant members of the Institution. It is of the utmost importance to the advancement of the status of engineers that no member of their profession shall be permitted to act otherwise than in accordance with the laws laid down to regulate their conduct. Whether or not those laws are the best and wisest that could be devised is immaterial to the principle at stake. Discipline must be maintained. We see in the medical and legal professions how stern a view is taken of infringements of the rules, and how promptly steps are taken to bring an offender to book; and unless an equally strict regime is followed by the engineering profession, it will never attain to the status which they have acquired.

THE excitement which has been seen in Lead. other metals, more especially in copper and spelter, has proved contagious, and lead has within the last week or so been in a fever of excitement. In May prices of prompt lead were down as low as £19 15s. It was pointed out at the time that the level then reached appeared to be a tempting one, and the forecast has been amply justified by the course of events, for prices have been rushed upwards in startling fashion with a very big business passing. It is decidedly puzzling, however, to ascertain the exact basis of the movement. The market has been filled with predictions that a big movement in an upward direction was in store, and to this extent, the improved tendency took nobody by surprise. Early this week £30 was paid for September, but there has since been a sharp reaction.

What is really astonishing, however, is the extent to which the advance has been carried with so little actual foundation apparent for the movement. There is, of course, a steady and regular business going on in lead, but the main impulse for the buying which has brought about so dramatic an upward movement was entirely speculative, the main portion coming from the United States. It is possible, of course, that something may have happened across the Atlantic justifying the altered tone, and warranting the phenomenal rise in prices in New York, where they are many pounds a ton above those ruling in the United Kingdom.

There is something very suspicious about the entire course of the market, and although it can be admitted frankly that consumption is very large, it is none the less incomprehensible how a rise of pounds in a week is to be justified on trade conditions. It is doubtful, indeed, whether there has been any material increase in the world's actual consumption during the past month or two, although during the same period production has been, if anything, increasing. The import returns into this country show a remarkable growth, last month's figures being as follows, in tons:—

			May.	May.	JanMay		
			1914.	19 <b>15.</b>	1914.	1915.	
Spain .		•••	6,547	9,354	33,400	43,858	
	•••	•••	2 233	12,537	7,935	27,847	
Mexico	•••	•••	154	_	1,312	250	
Australia .	•••	•••	5,415	9,118	34,122	32,005	
O.her Coun	trie:	•••	3 065	223	14,910	8,207	
Total .			17.414	31.232	94 679	112 167	

Not only are consumers very well supplied with lead, but there have been instances, although these may not be typical, in which consumers have been actually reselling a portion of their holdings, but, on the other hand, the excessive price to which spelter has risen may quite possibly result in the substitution in certain quarters of lead for spelter, as a coating for steel sheets to protect them from weather influences. An interesting criticism on the lead position has been issued by Messrs. James Forster & Co., in the course of which they point out that both Germany and Austria are self-contained so far as lead is concerned, and can probably p oduce as much as they want. Of the other producers, America has in the last two years probably increased her production of native lead by 150,000 tons per annum, and for the first time in this generation she has sent large and increasing quantities of native lead to Europe. Australia is producing more lead, and Spain is not falling behind in her shipments. There is indeed no lack of lead, and importers have been warehousing considerable quantities. In spite of this, however, the rise has been engineered with persistency, and the market is now undoubtedly very fully committed on the bull side, and looks none too safe, though manipulation of a powerful character may push it higher yet.

Trade with "Neutrals." obtain, still greater circumspection is desirable in placing orders abroad than under peace conditions, and though an advantage in price may be advanced as an adequate justification for accepting a foreign tender in normal times, it by no means follows that the same argument holds good now. Trading with

the enemy may assume various disguises, which may not be easy to penetrate, and we must not be unmindful of the ubiquitous ramifications of German trade interests, which like a gigantic octopus have laid their grip on industry in every part of the world. It is, therefore, most important to exercise the utmost caution in all transactions with firms that are in a position to deal with both parties, and that may be more or less under German control. We do not reproach such firms or accuse them of any wrong-doing; they are acting within their rights, but it is for us to be wary.

In view of what we have said above, the folly of placing British orders for electrical plant with them must be apparent. The fetish of the lowest tender which obsesses the minds of British municipalities, and blinds them to the true national interests, still holds sway in c-rtain places, even when we are at death-grips with our foes! We desire to enter the strongest possible protest against all such contracts that present the possibility of advantage and

support to our present enemies.

War and Quackery.

As an electrical journal, it does not very often lie directly within our province to discuss matters relating to the public health. There are, however, exceptional reasons, in days of general anxiety, why we should sound a note of warning against some of those various forms of quack "remedies" to which, as experience has proved again and again, the public is ready to fly for relief. We hold no special brief for the qualified medical man, but we do hold one against those who, with the aid of newspaper advertisement and pseudo-scientific pretences, are ready to take unfair advantage of the opportunity to batten on the earnings or savings of poor and rich alike.

Consider a few of the conditions that obtain at the moment, and will almost inevitably become the more acute the longer the war lasts. The number of returned wounded British soldiers probably runs into six figures, many of them having no medical claims under National Insurance; hundreds of thousands of men and women are in anxiety for their relatives with the Forces; professional men and familieshave been reduced in circumstances; the number of doctorsis depleted, and those at home are overworked; the hospitalscannot handle ordinary non-urgent cases as expeditionaly as a year ago, war cases rightly having preferential treat-ment. In conjunction with these conditions, bear in mind that the working classes have more money to handle, and are too ready to spend it, and we see the possibilities of a rich harvest for those who make a business of playing upon the feelings of people suffering either genuinely or imaginatively from neurotic and other disorders. speak with a ripened experience of the methods employed in the past by sharks of the kind referred to; we know something of the lengths to which they can go, the profits that they make, and the receptivity of the easily deluded mind, when we express a hope that the powers in authority will keep a careful watch over this matter. Pills and potions, and such-like, are not our commodity, and we may properly leave them to others, but where electro-medical " remedies," devices and appliances are in question there is a need for warning from those who recognize the dangers. Such warning is not only necessary in the interests of the uninitiated public, but also in the interests of legitimate electro-medical and electro-therapeutic science and practice. Properly applied, electricity has boundless possibilities for promoting and restoring health, but some of our older readers will remember how in days gone by an extensive traffic in electrical nostrums, which failed to cure, gave a serious set-back to legitimate effort. electro-therapeutics have advanced wondrously in recent years in our hospitals and elsewhere, and hundreds of thousands of sufferers have benefited from the boon thus placed at their disposal when applied by experienced men. There is a danger that at such a time as this, these and others may confuse the genuine and the spurious.

# BATTERY BELL SIGNALLING SYSTEMS IN MINES.

HOME OFFICE REPORT ON THE DANGER OF IGNITION OF FIRE-DAMP-AIR MIXTURES,

(Continued from page 816.)

In carrying out these experiments an 8 per cent. methane-air mixture was used throughout, and the make and break of the electric circuit were adjusted so as to give the most favourable conditions to produce a spark or flash to ignite the mixture. "These conditions represented the worst possible from the point of view of ignition by the break-flash," and were rather more stringent than those adopted for the experiments carried out at Senghenydd.

adopted for the experiments carried out at Senghenydd.

"Using a battery of dry cells, and with only the resistance due to the magnet coils of the bell (10 ohms) in circuit, ignition of the mixture was obtained by the break-flash with 2 cells, the voltage being 30 and the current on closed circuit 0.3 ampere. Ignition was also obtained when the current was reduced to 0.22 ampere by the introduction of 3.5 ohms (non-inductive) resistance, but not when the current was reduced below 0.21 ampere. One bobbin of the magnet was now removed, the resistance of the remaining bobbin being 5 ohms. Ignition was now obtained only when the current at 3.0 volts was increased to 0.34 ampere. The single-bobbin magnet was found to actuate the bell

terminals, while with 10 cells the current did not amount to more than about 1.4 amperes at 15 volts. Against this it is to be noted that a battery of two dry cells gave over 4 amperes, and one of 10 cells over 12 amperes, when shortcircuited across the terminals.

Probably most colliery electric signal bells are operated by Leclanche cells, hence the reason for high-resistance magnet coils on most of the bells in use. It is due to the demand for a bell that will give a loud signal with a very weak current, to allow for the drop in voltage of the battery when run down. Hence, as was to be expected, "it was found that with a battery of 10 wet Leclanche cells no ignition could be obtained when the single-bobbin bell, with diminished winding, was included in the circuit . . . since the minimum igniting current at 3 volts had been found to be 2 65 amperes, and increase of voltage to 15 does not materially affect the igniting power of the spark." On the other hand, though "the bell rang well with the full current from the 10 Leclanche cells, very little additional resistance, such as would be given by about half a mile of signal wire, served to put it out of action."

Experiments were made with another bell of better construction than the one used previously. The magnet had two bobbins, each with 20 layers of 28 gauge silk-covered copper wire wound on a soft iron core 2 in. long and \(\frac{1}{2}\) in. diameter. A battery of 10 Leclanche cells was used with a voltage of 15. The results are given in the following table:—

Condition of magnet.	Resistance of magnet. (1)	Current (bell only in circuit.)	Pesistar ce required to prevent bell ringing.	Current (bell and resistance in circuit).	Minimum igniting current.	Resistance required to reduce current to minimum igniting current. (6)
(a) Two bobbins	30 ohms	0°36 amp.	220 ohms	0.05 amp.	0 115 amp.	80 ohms
(b) One bobbin	15 ,,	0.22	230 "	0.02	0 17 ,,	55 ,,
(c) One bobbin. Four layers of wire removed	11 ,,	0.62 ",	210 ,	0 05 "	0.53 "	10 "
(d) One bobbin. Four more layers of wire removed	8 ,,	0 78 ,,	156 ,,	0.08 "	0 33 ,,	<b>2</b> 5 ,,
(e) One bobbin. Four more layers of wire removed	5 "	0.95 "	100 ,,	0 12 ,,	0.22 "	11 "
(f) One bobbin. Two more layers of wire removed	4 " .	1.00 "	70 "	0.165 "	0 95 "	1 "
(g) One bobbin. One more layer of wire removed. Five layers remaining	3.5 "	1.05 "	50 "	0 18 ,,		obtained using om 10 Leclanché

readily with two dry cells with an additional 8 ohms resistance in circuit, the current on closed circuit then being 0.21 ampere, i.e., well below the minimum igniting current."

Six layers of wire were then unwound from this bobbin, reducing the resistance to 3 ohms, when the minimum igniting current was found to be 0 61 ampere at 3 volts. The bell rang well with an additional 7 ohms resistance in circuit, with a current of 0.2 8 ampere. Six more layers of wire were then removed, leaving three layers only, with a resistance of 0.5 ohm, and no ignition could be obtained with the full current obtainable from the two dry cells employed, viz., 2.4 amperes, while the minimum igniting current was found to be 2.65 amperes. Thus it was shown that by removing one bobbin and reducing the number of layers of wire on the remaining bobbin it was possible to reduce the self-induction due to the magnet-coils, thereby increasing the current required for ignition by the breakflash, without destroying the ringing power of the bell.

By reducing the amount of wire in the bell, however, its resistance was reduced so that the current passing round the circuit was greater. Thus the full current obtainable on closed circuit from the two dry cells employed, with only the resistance due to the magnet coils of the bell, was (a) original bell with two bobbins each of 5 ohms resistance, 0.30 ampere; (b) bell with one bobbin having only three layers of wire, 2.40 amperes. Increased safety at the break-flash due to decreased self-induction is, therefore, to a certain extent negatived by increased danger due to the greater current available. To overcome this objection the dry cells were replaced by wet Leclanché cells (quart size), and a battery of two such cells, owing to the higher internal resistance, was incapable of giving a current of more than about 0.8 ampere at 3 volts when short-circuited across the

With regard to the last experiment, in which no ignition was obtained, it is to be noted that with 10 dry cells (15 volts) an ignition was obtained with 1.30 amperes with an additional 7 ohms resistance in circuit. Hence it is seen that provided not more than 10 wet Leclancké cells form a battery it is impossible to ignite the most sensitive mixture of methane and air, and a good ringing bell can be constructed to operate from such a battery provided it is kept in good order. "The reason for the impotence of the break-flash in the last case (g) lies in the greatly reduced self-induction of the circuit due to the removal of so many layers of wire. The extent to which the self-induction of a circuit wound on an iron core is reduced by reducing the number of layers of wire is illustrated by the following determinations made for 1)r. Wheeler by Prof. Thornton with the companion bobbin removed from the bell."

Fully wound With eight layers of	0.0920	henry	with a	current o	of 0.17	amp.
wire removed	0.0322	,,	,,	11	0 3 <b>3</b>	**
With four more layers of wire removed	0 0118	,,	. 11	,,	0 55	
With two more layers of wire removed					0.95	•
With one more layer of	0 0003	**	11	17	0 30	**
wire removed, five layers remaining	0.0068				1 30	
readers rememing	0 0020	11	11	19	1 30	**

If columns 3 and 6 be compared it will be seen that in each instance there was a considerable margin between the resistance that could be added to the circuit before the ringing power of the bell ceased, and the resistance necessary to reduce the current available at the break-flash below the minimum igniting current. Thus with the bell as ordinarily arranged with two bobbins, and with a battery of 10 wet Leclanche cells, ringing just ceased when 220 ohms extra resistance was included in the circuit: while the

minimum igniting current of 0 115 ampere was obtained when 80 ohms resistance was added. Hence, if there were added as an integral part of the bell a non-inductive resistance of, say, 90 ohms, the break-flash would be harmless in the most sensitive explosive mixture—provided, as previously mentioned, that not more than 10 Leclanche cells were used -leaving 130 ohms resistance for signal wires, which would be equal to about 10 miles of No. 8 galvanised iron wire, before the bell would cease to ring. It appears, therefore, that the resistance of the signal wires should be measured, and the difference made up with some form of adjustable resistance attached to the bell.

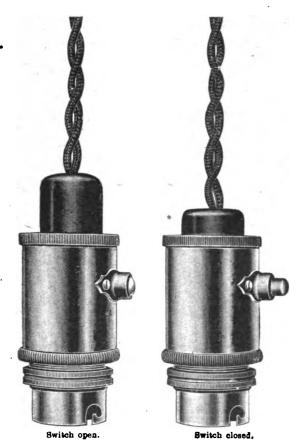

(To be concluded.)

### NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

#### H.O. Switch Lamphoider.

MESSES. G. ST. JOHN DAY (PATENTS), LTD., of Oldham, have recently introduced a new patent switch lampholder, H.O. pattern, of unusual design, styled the "Daybreak." Briefly, the action is such that "switching on" moves the plunger contacts down on to the lamp cap, while switching off causes them to by withdrawn by a spring movement

The central portion of the holder, which projects at the top, fig. 1, containing the wiring and plunger contacts, is pressed down to the position shown in fig. 2 to switch on, and is held in that position by a spring catch at one side of the holder. Incidentally, the

FIGS. 1 AND 2.4" DAYBREAK" H.O. SWITCH LAMPHOLDER.

lamp (then lighted) is locked in the holder. Pressing the side button releases the catch, allowing the central portion to be forced up (by a spring under compression) and this withdraws the plungers from the lamp cap, thus breaking the circuit. The holder can be taken to pieces by unscrewing a milled ring at the top of the case.

Among the meritorious features claimed by the makers, are that the lamp cannot be removed when lit, nor fixed when the switch is on. The holder is absolutely shock-proof; the circuit is broken at each pole; and the switch can be operated by one hand. The holders are made in the usual standard types and

#### New Tucker Tumbler Switch.

A new pattern "quick make" and 'quick break" tumbler switch, fig. 3, has just been introduced to the market by MESSES.

J. H. TUCKER & Co., of King's Read, Hay Mills, Birmingham, to fill the demand of consulting and other engineers for this particular switch movement.

A positive action is obtained in the initial opening and closing of the switch; the contacts are of special design; micanite insulation is used throughout, and the base is of vitrified porcelain. In conformity with the firm's custom, this switch movement has been carefully tested, having been mechanically operated over two million times without breaking down.

FIG. 3.—TUCKER "QUICK MAKE" AND "QUICK BREAK" SWITCH.

The ordinary one and two-way patterns with china or braces occurs are made uniform in external appearance with the Tucker fist-type switches.

#### "Witton" Handguard Cut-Outs.

We illustrate in figs. 4 and 5 the "Witton" handguard cut-out, which has been introduced by the GENERAL ELECTRIC Co., LTD., Witton, Birmingham, as an improvement on existing designs.

The handle and carrier is composed of one porcelain block designed to enclose the contacts of the fuse carrier and the clips on the base. The fuse possesses a self-aligning contact, which is mounted on the porcelain carrier by means of a stud projecting horizontally into the porcelain and held by a nut, the recess for which is seen from the front of the carrier, and is closed by a policelain cap cemented in. The contact is not held tightly: a porcelain cap cemented in. The contact is not held tightly;

FIGS. 4 AND 5.-CONTACTS ON CARRIER, AND CLIPS ON BASE OF "WITTON" HANDGUARD CUT-OUT.

spring washer gives the contact a small amount of freedom in every direction without interfering with its general rigidity. This freedom is adequate to enable the contacts to adjust themselves to meet any want of alignment in the clips.

A further feature of the handguard out-out is its adequate venti-lation. As will be seen, each contact is cut away at the base so that ample facilities are provided for the access of air to the fuse wire. The latter is carried in the usual asbestos tube which passes through the tubular carrier.

The cut-cut is made in a number of sizes, ranging from 15 to 600 amperes.

Standardisation of Electric Motor Vehicles.—The Standards Committee of the American Society of Automobile Engineers, which is stated to be acting in conjunction with the Electrical Vehible Association of America, has recently devoted considerable attention to the standardisation of certain components of electric motor vehicles. For example, it is proposed to encourage the reduction of practice to two voltage ranges for such vehicles, namely, 80-85 volts and 60-66 volts. For the lead-acid type of accumulator, a standard of 42 cells is to be recommended, while for the nickel-iron-alkaline battery, 60 cells are proposed. Among other recommendations contained in the first report of the Standards Committee are speed and mileage ratings, motor voltages, standard name-plates for electric motors, and the efficiency of solid tires for electric vehicle?.

#### CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communi-cations at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

#### The Telephone as Nursemaid.

Three years ago our little boy, only a few months old, was despaired of by our doctor, who recommended open-air treatment as the only hope for his life.

as the only hope for his life.

The busy mother could not spare time to be always out with baby—nor could she be continually running out to look after him. Thus the writer was driven to the idea of fitting a telephone transmitter in the pram. The transmitter was placed inside a cigar-box, which also contained a small American clock (fig. 1).

Baby then spent all his sleeping hours outside, 20 yards away from the house, while the mother could listen in the intervals of work, knowing that so long as she could not hear baby crying

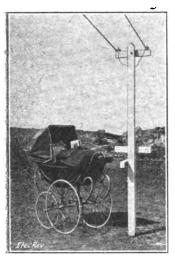

Fig. 1

Fig. 2.

but could hear the clock ticking, all was well. The clock was necessary to provide a constant assurance that the telephone was in

Before our doctor went to the Front he made a thorough examination of our boy, and was pleased that open-air treatment, with other care, had removed all traces of his early weakness.

Birds will not approach our house owing to cate, so the old baby's telephone post was utilised to provide a cat-proof feeding

This was frequented chiefly by robins and finches. The idea then occurred to fit a telephone transmitter above the tray so that the birds could be listened to in the house (fig 2)

This experiment would be still more successful if the telephone ransmitter could be concealed among the branches of a tree, in a glade frequented by nightingales, for instance. Here, alas, we have

The photograph (fig. 2) shows the telephone baby as he is to-day.

It may be noted that after months of winter use outdoors, protected from rain only by an inverted tig, open at its lower end, the telephone transmitter remains in perfect order.

#### Cab Signalling.

Allow me to say that you are performing a much needed public service in permitting the publication of the truth concerning the culpability of the railways and the Board of Trade.

Your correspondents, with the exception of Mr. Von Kramer, have written most clearly and logically about facts that ought to be given the widest publicity at the present time. The extent to which some technical journals have misinformed their readers on this subject makes it all the more important for an electrical yournal of the highest standing to allow the exact truth of the whole matter to be told in its columns.

The signalling of our steam railways is a national disgrace. We

whole matter to be told in its columns.

The signalling of our steam railways is a national disgrace. We are many years behind America in track circuiting, and France in cab signalling, although we have all along needed both of these electrical improvements as badly as America or France has meeded them. Worse still, even in the little our railways have done in the way of adopting or playing with cab signals, they have, without a single exception, given preference to the inferior types. I say "played with," because the word "test" is a mismomer when applied to the wireless foolishness on which the Midland and the London and South-Western Railways have wasted so much valuable time. so much valuable time.

Messrs, Acfield and Sayers know that the Dammond cab signal is

by far the best that has ever come before the British public, or else they know less about this signalling subject than hundreds of

persons who, like myself, have no interest in any signalling mechanism, but have had sufficient technical training and experience to judge of the merits of such things.

Like these hundreds ence to judge or the merits of such things. Like these hundreds of other technical men who have carefully studied this subject, I want to know why the Midland Railway Co. has discriminated against the best cab signal that has yet been produced, and in favour of two that are decidedly the inferior of the former. In the meantime, as others have aptly said, "The Board of Trade still mores on."

#### LEGAL.

H.M. POSTMASTER-GENERAL r. SOUTHWARK BOROUGH COUNCIL.

AFTER a long hearing, which occupied many days, Mr. Pollock, one of the High Court Referees, on June 10th concluded and gave judgment in this case, which arose out of the necessity relay the telegraph and telephone cables consequent upon the construction by the Borough Council of a subway beneath the cross-roads at the Elephant and Castle.

Mr. Holman Gregory, K.C., and Mr. Branson appeared for the Postmaster-General, and Mr. Hudson, K.C., with Mr. Frank Dodd, for the Southwark Borough Council.

Mr. HOLMAN GREGORY. in the course of his comments at the

ME. HOLMAN GREGORY, in the course of his comments at the close of the hearing, said that in all his long experience he had never come across a more unfortunate, or, he might say, a more scandalous piece of litigation, the amount in dispute being only £259, while the costs incurred could not be less than £8,000. The Council, however, said that they had overpaid the Postmaster-General, and as they were going to try and get some of the money back they were not fighting for the £259 only.

back they were not fighting for the £259 only.

The action was brought by the Postmaster-General to recover under the Telegraphs Act of 1878 the balance of certain money which had been expended in relaying the cables rendered necessary by the works of the Borough Council. Under the Act the Postmaster-General claimed the right to make alterations in the telegraph line, and to charge the Borough Council with the cost. or to call upon the Council to do the work. In this case the Postmaster had done the work and had charged the Council with the or to call upon the Council to do the work. In this case the Postmaster had done the work and had charged the Council with it, the total sum being £1,640. Of this all had been paid with the exception of the balance now claimed, as to which the Council contended they were not liable, as the cost had been increased by the Postmaster-General laying additional ducts. The question was whether more money had been spent in laying 22 ducts than would have been spent in laying the original 13 ducts, and the Council said that under the circumstances the Post Office should bear 9/22 of the cost as representing the additional nine ducts and the Council 13/22 as representing the original 18 ducts which

had to be re-laid. The Post Office engineers contended that so far from increasing the cost, the laying of the nine additional ducts would be a saving in cost, as the boring would have to be the same size for 22 as for 13 ducts, and the additional nine would same size for 22 as for 13 ducte, and the additional nine would occupy space which would otherwise have had to be filled up with coment. There was no suggestion in the defence that the designs were wrong or wasteful, but it was alleged that the charges were excessive and unreasonable. On the other hand, it was contended that the question of design and the amount of work necessary to be done were entirely in the hands of the Postmaster-General. The only point, said Mr. Holman Gregory, was whether the Postmaster-General had incurred extra costs by making provision for 22 ducts instead of only 13, and he submitted that the evidence showed that the cost had not been increased thereby.

The Official Reference in giving indement, said he quite agreed

evidence showed that the cost had not been increased thereby.

The OFFICIAL REFEREE, in giving judgment, said he quite agreed that the case was a most unfortunate piece of litigation, and it looked to him as if some people desired to show that their opinion was better than someone else'r, and having given their opinion were prepared to substantiate it at the cost of the ratepayers. If were prepared to substantiate it at the cost of the ratepayers. It was clear that the cost of litigation was enormous as compared with the small sum in dispute. By the order of Mr. Justice Lush he was directed to ascertain what would be the cost of the work upon the basis of 13 ducts, and what would be the cost on the basis of 22 ducts. Early in the year 1910 it was known that the Borough Council was going to construct the subway having a centre near the Elephant and Castle, and notice was given to the Postmaster-General in regard to the matter. The Postmaster-General thereupon decided upon to the matter. The Postmaster-General thereupon decided upon what work was necessary in relation to the alteration in the telegraph lines, and he decided that that work should be carried out by the Post Office. The alterations consisted of the abandonment of two underground telegraph lines containing 13 ducts and the construction of a new line, comprising an underground conduit, the construction of a new manhole, and the enlargement of the existing manhole. While carrying out the work the Postmaster-Gmeral increased the number of ducts to 22, which necessitated an increase of a foot in the length and a foot in the width of the new manhole, an increase of one foot in the width of the trenching and of a foot in the existing manhole over and above what would have been necessary if the conduit laid had contained only 13 ducts. A correspondence took place between the Postmaster-General and the Borough Council's engineer, and after some dis-13 ducts. A correspondence took place between the Postmaster-General and the Borough Councit's engineer, and after some discussion a plan was adopted, showing the general outline under which the Postmaster-General proposed to carry out the work. Some small question was raised as to the date at which those who were doing the work became aware that some alteration was going to be made in regard to the subway which affected the direction of the telegraph liner. In his view the truth lay with those who gave evidence on behalf of the Postmaster-General. The plan was submitted to Mr. Harrison, and no alteration was made in it until they came upon the water which they met with while carrying out the work. The Postmaster-General's officers in carrying out the work. The Postmaster-General's officers in carrying out the work began upon the assumption that the subway was as close as possible up to the point where the new manhole was to be constructed, and that necessitated carrying down the manhole to a considerable depth so as to get below the subway. Originally a plan was put forward by which it was proposed that the manhole should actually be under the subway, but the engineers came to the conclusion that it was almost impossible to carry out such a plan as that, and it was almost impossible to carry out such a plan as that, and it was acting as engineer to the Borough Council, and was aware of the work which was going on. It was competent for him to have gone to Mr. Noble, who was doing the work for the Postmaster-General, and point out that he was doing more than was necessary. But he did not do anything of the kind. The work having been carried and point out that he was doing the work for the Postmaster-General, and point out that he was doing more than was necessary. But he did not do anything of the kind. The work having been carried on was completed towards the end of the year 1911, when application was made for payment of the account. When that application was made certain objections were raised, and it was suggested that the Postmaster-General had not done the work merely for the purpose of altering the position and direction of the work for 13 ducts, but had done all the work with a view to enabling the Postmaster-General to carry 22 ducts, and Mr. Harrison suggested that it would be reasonable that the Postmaster-General should pay 9/22nds of the costs. That would strike one as being a taking proposition, but it was one which would be absolutely improperly because it was clear that the extra provision would not necessarily increase the cost of the work in proportion. The Postmaster-General had behaved handsomely in giving up some of the extra maintenance, as it was one of the incidental expenses for which he maintenance, as it was one of the incidental expenses for which he was entitled to be paid had he insisted upon it. Then came the question as to what were the extra expenses consequent upon the increase in the number of ducts; but as to that no evidence had been given. There had been, however, suggestions that there were faults in the design which had increased the cost of the work, and, in support of this, a number of expensive models had been produced in evidence. The question then arose as to who was the proper person to decide as to the proper manner of carrying out the work rendered necessary by the proper manner of carrying out the work rendered necessary by the construction of the subway. He did not intend to take upon himself the duty of saying what was right and proper under the circumstances. In fact, by the Act of Parliament he was precluded from doing anything of the kind. The Act said that the alteration was to be made as the Postmaster-General might deem necessary and expedient. That being the statute, and the work being down under the statute, when the matter came into Court it was said and expedient. That being the statute, and the work being done under the statute, when the matter came into Court, it was said that the Postmaster-General had deemed the work necessary and expedient. No denial of this had been put forward in the defence, and therefore he could only deal with the matter as it came before him. He must deal with it as having been admitted by the

defendants that the Postmastor-General deemed the work neces and expedient. Various questions had been raised in defence, but they were questions as to whether the expenses were such as ought to have been incorred, having regard to the fact that the Post-master-General had considered the work necessary and expedient. That rendered it quite unnecessary for him to go into the elaborate estimates and calculations made on behalf of the Borough Council. estimates and calculations made on behalf of the Borough Council. Mr. Noble and Mr. Hardy had been calfed on behalf of the Poetmaster-General, and they gave evidence in support of the view that the work was in substance necessary for the 13 ducts. Mr. Noble said it was necessary to carry down the manhole to the depth to which they did carry it, in order to carry the pipes under the subway. He said that when they got down to a certain depth they met with a considerable quantity of water which rendered extra work necessary. He (Mr. Noble) also said that in carrying the hole down to the greater depth it was necessary to make it larger, having the greater depth it was necessary to make it larger, having regard to the health of the men who worked in it. It was thereregard to the health of the men who worked in it. It was therefore useless to suggest that the Post Office authorities had made the manholes deeper than was necessary. It had been suggested that Mr. Noble was wrong when he said it was necessary, and he (the Referee) had to consider what was the extra cost, if any, in making the conduit for a greater number of ducts. It was obvious that in making the manholes deeper they must be made larger, and then they would be available for the larger number of ducts. The Postmaster-General had taken the trouble to correspond personally upon the matter, and he (the Referee) came to the conclusion that those who advised him had advised him properly. When it was said that the work was necessary and expedient he was not in a position to contradict it in any way. He was satisfied upon the evidence of Mr. Noble and Mr. Hardy that the work was properly done, and that it was necessary and expewas actisted upon the evidence of Mr. Noble and Mr. Hardy that the work was properly done, and that it was necessary and expedient—that it was work properly done on the basis of 13 duets. When the Postmaster-General said that the work was necessary he could not in any way interfere. There must be judgment for the Postmaster-General for £259 10s. 5d., with costs.

Judgment was entered accordingly.

#### A HOUSE WIRING DISPUTE.

In the Marylebone County Court, on June 4th, before his Honour Sir W. Lucius Selfe, Mesers. Watson, Marsh & Co., electricians, High Street, Brondesbury, sued John Morris Goodwin, owner of South Mansions, Streatly Road, Kilburn, for £3 7s. 6d., balance of an account for work done. In support of the claim, Mr. Marsh said his firm had received instructions to fit up No. 16 flat in these mansions with electric light, to suit a new tenant. The amount of the work and materials was £9 5s. Defendant had paid a sum on account, and left the balance now claimed. Defendant said that the work to be done in this flat was similar to that in one of the flats balow it, and the charge there was just over £6, the mount he had reid as affecting the same of the flats.

the fists below it, and the charge there was just over £0, the amount he had paid as suffizient.

PLAINTIFF: The work was the same, except that there was additional main to be run from the Willesden Council service, and there was an additional point, and these accounted for the extra cost in this flat. The actual cost of the work was £6 14s. 7½d., and the balance was for office expenses, insurance, and masters'

MB. GOODWIN: But the lines were put in wooden casing in No. 14, and in this one in tubing.

DEFENDANT: Some were in casing and some in tubing. His HONOUE: How much was the additional tubing? PLAINTIFF: About 30s.

MR. GOODWIN: They need not have put in the tubing; they can take it away whenever they like.

His HONOUR gave judgment for £2 5s. 61., and costs.

#### GERMAN ELECTRIC POCKET LAMPS.

In the City of London Court, on June 15th, before his Honour Judge Rentoul, K.C., Messrs. Millard Bros., Ltd., electrical engineers' agents, 123, Houndsditch, sued H. Fox, ironmonger, New Market, Houghton-le-Spring, Staffordshire, for £3 8s. for 1,000 Garman pocket electric lamps supplied. Defendant did not dispense the chain that he missed a counterplain for damages for

Garman pocket electric lamps supplied. Defendant did not dispute the claim; but he raised a counterclaim for damages for non-delivery of other electric lamps ordered.

MR. AUSTIN FARLEIGH, plaintiffs' counsel, said that the goods in dispute were Millbro batteries. They had been in the habit of coming from Garmany. There was a peculiarity about the present contract, as there was a condition printed upon it which said that the plaintiffs were not to be held responsible in damages "for failure or delay on their part in delivery, resulting wholly or partially from strikes or combinations of workmen or employés, or from any unavoidable total or partial stoppage of works, or from any other cause whatever." Plaintiffs were only the agents for the importation of goods. They were not able to get the goods owing to the war, in time to deliver on August 1st, as promised. But the contract exculpated them from any responsibility for non-delivery. The goods were on the quay at Hamburg still and could not be got over to England. over to England.

DEFENDANT stated that the goods were to have been delivered on August 1st, and if the plaintiffs had made their arrangements in time, that could have been accomplished, in spite of the war, which was not declared by England until August 4th. The breach

of contract occurred on August 1st.

MR. FARLEIGH: There was an embargo on the goods, and mobilisation was going on before August 1st. The order was given in May, but if we had sent them over then they would have died

before delivery. It is a chemical production, and the batteries were only guaranteed to last for six months. They cannot be re-charged.

MR. WILLOUGHBY, plaintiffs' secretary, said their output of the lamps was 500,000 a year, and they had to disappoint a great many firms. There were still 17 cases, containing 5,000 lamps each, on the quay awaiting shipment at Hamburg.

JUDGE RENTOUL held that the condition of the contract exempted the plaintiffs from any liability, and he found for the plaintiffs for the amount claimed on the claim and counterclaim, with coets. with costs.

#### BECK ENGINEERING Co., LTD.

A PETITION to wind up this company compulsorily, presented by the Slam Electrical Co., Ltd., was before Mr. Justice Neville on Tuesday. Mr. Harrison, for the petitioners, however, announced that the matter had been settled, and he asked that the petition' should be dismissed, without costs. His Lordship dismissed the petition accordingly.

#### WORKMEN'S COMPENSATION CASE.

WORKMEN'S COMPENSATION CASE.

In the Bow County Court on Tuesday, before his Honour Judge Smyly, K.C., and a jury, the resumed hearing took place of a claim under the Workmen's Compensation Act, in which Arthur Edwin Attwell, an engineers' fitter, asked for an award against the West Ham Corporation electricity department. It appeared that the applicant was engaged in cleaning out transformer substations in connection with the electricity department. The electricity was generated at the main station at a pressure of 6 000 volts, and these transformer substations reduced it to a pressure of 200 volts. The defendants had to regulate the working of these sub-stations in accordance with the regulations laid down by the Sacretary of State under Act of Parliament, and to have these by the Secretary of State under Act of Parliament, and to have these dangerous places safeguarded so that no accident could occur. The applicant was not an expert electrician, only a workman, and The applicant was not an expert electrician, only a workman, and it was therefore more than necessary that they complied with the Act. On April 6th, 1914, the applicant was dusting the incoming main cable when he received a shock and was rendered unconscious. For some time it was thought he had been killed right out. The applicant gave evidence, and said that his hand was badly burned and charred. In his opinion, there was a defect in the insulation. He was paid full manus 37s 61 a week for 10 weeks and then it man appropriate that opinion, there was a defect in the insulation. He was paid full wages 37s. 61. a week for 10 weeks, and then it was suggested that be should do light work. He did do a little walking round with the men, but was unable to do any of his former work, and his money was stopped. He was asking for an award of half wages. He was 31 years of age, and had no technical knowledge of electricity. His duties were the cleaning of transformer chambers, and he knew nothing of insulation. This chamber was 5 ft. square, with a barrier to keep one away from high-tensions witches. When the accident happened he was dusting the porcelain where the main cable was connected with the transformer. His left hand became like a piece of bad meat. He now suffered with suffocating pains in the chest. After the accident he was asked to say that he was burnt by the lead that enclosed the wire, and not the porcelain, as if he said porcelain there would have to be a Local Government Beard inquiry. He had never been supplied be a Local Government Board inquiry. He had never been supplied with rubber gloves to work in. He never saw a notice stating that high-tension switchgear might not be touched unless one wore high-tension switchgear might not be touched unless one wore rubber gloves, or stood on the insulating stool or mat. Copies of time sheets were put in to show that the man had been used to high-pressure work, but he said somebody was always with him. Other sheets produced suggested that he had been working since the accident, but he denied this, and said he only walked round with the man, making out the time sheets as he was told. The defence was that the man had never really been "shocked," only burned, and was capable of working. A mass of medical evidence was called to that effect, and the hearing was again adjurned. adjourned.

#### WAR ITEMS.

London Works and War Munitions.-It is announced several daily papers that as the result of a private meeting held recently at the Institution of Civil Engineers in London a Committee has been formed for the purpose of utilising workshop and other suitable accommodation in the metropolitan area for the production of munitions of war. The presidents of the Institutions of Civil, Mechanical, and Electrical Engineers are on the Committee, as are also the leading engineers associated with public works. It is proposed to bring under one central control, such accommodation in workshops and stations of lighting, gas, power and water companies. Mr. F. J. Walker, managing director of the St. James's and Pall Mall Electric Light Co., Ltd., is honorary secretary of the Committee. In the first instance information is being collected as to the engineering plants in the metropolitan area that are Committee. In the first instance information is being collected as to the engineering plants in the metropolitan area that are available. The Times states that the proposal was due to Mr. W. A. Harper, of Messrs. Harper Bros. & Co., consulting engineers, and that the Munitions Committee at the War Office has given its approval. The Westminster Gazette says it is estimated that amongst public authorities affect that amongst public authorities affect that amongst public authorities affect that amongst public authorities are the War Office has given its amongst public authorities affect that amongst public authorities are the War Office has given its amongst public authorities affect that the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the work of the wor

Coal-Mining and the War.—The Departmental Committee's report on the effect of the war on the coal-mining industry shows that up to the end of February 191,170 persons from each mines

had joined H.M. Forces. It is considered that the time has arrived when very full deliberation should be given to the question as to whether further recruiting among miners should be encouraged. The loss in production for the year commencing from the outbreak of war will, unless means are taken to reduce the loss, probably amount to 36 million tons. Against this is put a reduction of 21 million tons in exported coal, leaving a net shortage, without further enlisting, of 12 million tons. Among other matters referred to by the Committee is the effect of the Eight Hours Act, and a conference between owners and workmen to determine to what extent, if at all, the Act should be suspended in individual districts, is recommended. The Committee in mentioning the importance is recommended. The Committee in mentioning the importance of economy in the use of coal by the public mays:—"Savings which at once occur to the mind are economies in public and private lighting, whether by gas or electricity, and the manufacture of luxuries which require coal."

Greece.—In a report, shortly to be issued, by H.M. Consul at Pirgens, on the trade of that district in 1914, it is stated:—"As compared with imports from the United Kingdom, Austria-Hungary has imported into Greece more than twice the amount in value of the following goods:—Electro-technical appliances, electric conduction apparatus in boxes, electric motors, dynamos, transformers, in the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the sta switch and contact devices, mounted fuses, &c., and also electrical fittings, electric lamps, high-pressure cable and transmission lines, and electrolytic copper.—Board of Trade Journal.

Board of Trade Inquiries.—The list of inquiries received for the week ended June 5th for sources of supply of goods, contains

the following items :-

Electrical fissh lamp cases with switches.
Insulated brass conduit tube to compete with Bergmann tube.
Pea lamps with cord and adapters attached.
Motor lorries, electrically driven.
Tachometers.

Personal.—Mr. Roland J. Prankherd, formerly assistant charge engineer to the Hackney electricity works who, as already announced, joined the 9th East Surreys some months ago, obtained his commission as Second Lieut. in the 22nd Batt. N.F. (3rd Tyneside Scottish); on May 14th. His present address is at "A" Camp,

We learn from Messre. W. Canning & Co., of Birmingham, that their chief chemist, Dr. W. E. Hughes, M.A., B.Sc., lately serving as a private with the U.P.S. at Epsom, has been granted a commission and been gazetted to the Leicesters. One of their chemical workers, T. Muggaridge, serving with the Worcesters, is a prisoner at Ohrdruf. James Casson, a chemical warehouseman, has been killed in action with the Royal Berks, leaving a widow and three children. and three children.

Mr. Gilbert Rosenbusch, M.I.E.E., Assoc.M.Inst.C.E., &c., who is an American citizen born, has changed his named to Gilbert Rowe. In making this announcement, Mr. Rowe desires to dissociate himself from everything German, and expresses his horror and disgust at the methods employed by the German army and navy, which culminated in the Lusitania atrocity.

Mr. J. B sett, of the British Westinghouse Electrical and Manufacturing Co., Ltd., Trafford Park, has been appointed secretary to the Manchester Munitions Committee.

Roll of Honour.—Private C. I. Macdonnell, who has been on service with the 6th West Yorkshire Regiment, is now lying at the First Eastern General Hospital, Cambridge, having been shot in both legs. He was an electrical engineer working in Bradford

in both legs. He was an electrical engineer working in Bradford prior to the outbreak of the war, and is 28 years of age.

Amongst those who are suffering from the use by the Germans of asphyxiating gases is Captain Austin Graham, of Barnard Castle, connected with the 4th Yorkshire Regiment (T.). He is at present in Ludy Eveline Mason's Hospital in London. Captain Graham is an electrical engineer.

Graham is an electrical engineer.

Private Peter Tolland, of the 2nd Battalion Black Watch, who has been awarded the D.C.M., was prior to the war in the service of the Greenock and Port Glasgow Tramways Co.

Private J. Kilby, of the 1st Northants Regiment, formerly employed by Northampton Electric Light Co, was killed at the Front on May 9th. He was 25 years of age and enlisted in August, going to France in January.

Private A. Meecher, of the Boyal Field Artillery, who was engaged on the Hull tramways, has been killed in action.

Intelligence has resched Stockport of the death from wounds

Intelligence has reached Stockport of the death from wounds received in action in the Dardanelles of Petty Officer Mechanic Oswald New, who was formerly with Messrs. McClure & Whitfield, electrical engineers, of Stockport. He joined the Boyal Naval Division last autumn, and went to the Dardanelles in March with the Armoured Car Squadron attached to the Royal Naval Division.

was in his 31st year.

The heavy losses in the East Lancs. Division in the Dardanelles include the name of Major E. L. Baddeley, of the 8th Batn. Lance. Fasiliers, who died in action June 5th. He was second in command, and held a long service with the battalion, taking field rank in January last year. He was secretary of Messrs. W. T. Glover and Co., Ltd., Trafford Park.

('antield Tape.—The CANFIELD RUBBER Co., of 27-28, Noble Street, E.C., have brought to our notice their "Canfield" black insulating tape—a strong material impregnated with an adhesive rubber compound which will not dry out; white, gray and red tape is also made. Tests carried out at a well-known laboratory on a single thickness of the tape showed that the presence of the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the stape showed the sta sure required to produce a puncture averaged 970 volts, and the net length of tape per pound was 164 ft.

#### THE PRACTICAL RESULT OF THE POINT FIVE TARIFF.

By A. S. BLACKMAN AND THOS, ROLES,

(Abstract of Paper announced for reading before the Incor-PORATED MUNICIPAL ELECTRICAL ASSOCIATION, June 17th, 1915.)

PORATED MUNICIPAL ELECTRICAL ASSOCIATION, June 17th, 1915.)
The following is a list, in chronological order, of the undertakings which have adopted the Point Five Tariff, together with the dates upon which the same was put into force:

Poplar, 1909; Southampton, 1910; Luton, 1910; Bradford, 1910; Sunderland, 1912; Barnes, 1912; St. Marylebone, 1912; York, 1912; Carlisle, 1912; Wrexhain, 1913; Accrington, 1913; Sheftield, 1913; West Hartlepool, 1913; West Hain, 1913; Wolverhampton, 1913; Ilford, 1914; Blackpool, 1914; Wakefield, 1914; Worcester, 1914; Ipswich, 1914; Leeds, 1915; Chester, 1915.

The majority, if not all, of the earlier undertakings to adopt

The majority, if not all, of the earlier undertakings to adopt the Point Five Tariff did so as a result of independently coming to the conclusion that no substantial progress could be made in the supply of electricity for heating and cooking purposes in their areas at any rate exceeding one-halfpenny

per unit.

To the Metropolitan Borough of Poplar belongs the honour of being the first electricity supply authority to adopt such a tariff. The fixed charge at Poplar is varied in the case of the different premises supplied in accordance with the number of kilowatts installed for lighting, heating, cooking, and other purposes, and includes a service charge and charges for the hire of wiring and consuming devices in cases where the two last-mentioned items are supplied by the undertaking on the hire

Southampton, the second town to adopt a Point Five Tariff, makes the granting of a halfpenny rate for heating and cooking purposes conditional upon the consumer installing a tain minimum number of lights charged for at ordinary light-

ing rates.

Luton, the next town to institute a Point Five Tariff, supplies current for heating and cooking purposes at a flat rate of one-halfpenny per unit without any fixed charge or conditions as to lights being installed on the premises

supplied.

Bradford, the fourth town on the list, decided to confine its Point Five Tariff to donestic premises, and to base it on the "Norwich" or rateable value system of charging which, with a secondary charge of one penny per unit, had already proved its utility in a number of towns; and practically the whole of the undertakings which have since become converts to the Point Five principle have adopted this system

So far as the writers are aware, the two methods cited above of arriving at the fixed charge (where made) are the only ones which have been adopted up to the present in connection with Point Five Tariffs, and the difference between these methods is but one of convenience in the working of the tariff, the fixed charge per kilowatt being more strictly correct in individual cases, whereas the apportionment upon the size of the house is an average result which has been found to be a sufficiently close estimate for all practical purposes, and to possess the great advantage of uniformity and simplicity in application.

should be recognised that the rateable value basis is only made use of as a means which is ready to hand of deter-nining the fixed charge approximately in accordance with the electricity consuming capacities of the premises supplied, and any other readily available basis might be adopted. This method of charging was initiated and put into use by Mr.

F. M. Long, of Norwich, over eight years ago.
In most towns in which a Point Five Tariff, based on the rateable value system, has been instituted, the rate is restricted to the supply of electricity to private houses, as this method of determining the fixed charge does not so readily lend itself to the more widely varying conditions of other classes of supply. The percentage of the net rateable value decided upon varies in different towns, being usually between 10 per upon varies in different towns, being usually between 10 per cent. and 15 per cent. per annum. In at least one case (Sunderland) the percentage is varied between 10 per cent. for a house rated at £30 to 15 per cent. for a house rated at £70 and upwards, the reason for this being that a large house generally furnishes a worse load factor than a small one.

In the case of both Bradford and Sunderland the tariff adopted has been left to justify itself, and no scheme of hiring out heating and cooking apparatus is in existence in either town. Had such hiring schemes been inaugurated, and energetic and sustained publicity campaigns been instituted by the two undertakings, the results shown in this report would have been still more favourable.

In the application of a Point Five Tariff, based upon rateable values, a discretion should be exercised in favour of the consumer who, in consequence of living in a house with an

consumer who, in consequence of living in a house with an abnormal amount of ground attached to it, is rated out of proportion to the size of the house.

marked advantage of the rateable value basis is the facility with which an accurate estimate of a consumer's bill can be prepared. Once the fixed charge for a house has been as no prepared. Once the fixed charge for a lodge has been assertained, a wide error may be made in assuming the number of units that will be used, and the estimate still remain reasonably correct. This facility for estimating has been found in practice to be a very useful asset to the canvassers in towns where a cheap supply of gas has to be competed against. It likewise follows that the importance of any error in metering is correspondingly lessened.

Numerous other advantages have attended the adoption of

a Point Five Tariff based on the rateable value system, amongst which the following may be cited:—
When charged under the ordinary flat rate for lighting pur-

ses it was, as a rule, found that residential consumers only poses it was, as a rule, found that residential consumers only introduced electric light into the best rooms, leaving the servants' quarters, etc., which possess a better load factor, illuminated by gas. The fact, however, that on the rateable value basis, once the fixed charge is assessed, all current required for lighting, as well as for heating and cooking purposes, is supplied at the low price of one-halfpenny per unit, has in most cases induced private house consumers to light the whole of their premises electrically, with a consequent improvement in the load factor of the installations.

Further, carelessness on the part of members of households

Further, carelessness on the part of members of households in leaving lights burning while rooms are not in use does not result in the amounts of the accounts being unduly

inflated.

In addition to this, under a flat rate of charge the lighting In addition to this, under a flat rate of charge the lighting of most houses using electricity compared unfavourably with that of houses illuminated by gas, especially where the mantles in the latter were kept in good condition. The reason for this was that, on the score of economy, lamps of only small candle-power were generally in use. The making of the fixed charge in a house of any given rateable value quite independent of the number and size of the lamps installed, coupled with the supply of current at a cheap rate, has resulted in with the supply of current at a cheap rate, has resulted in consumers using lamps of considerably higher candle-power, consumers using lamps of considerably higher candle-power, thus obtaining an illumination at least equal to that of gaslighted premises. It is now usually quite easy to determine whether or not a house is on the Point Five Tariff by the brilliancy of the light proceeding from the windows of premises taking a supply under this rate.

Taking this class of supply altogether, the additional expenses to the Undertaking consist of the cost of increasing the capacity of the generating plant—which can now be done at far cheaper rates than in the days when the flat rate for lighting purposes was decided upon—and the provision of extra feeder cables.

In both Bradford and Sunderland it has been found that

In both Bradford and Sunderland it has been found that the majority of new domestic consumers adopt the rateable value tariff; houses are, as a rule, wired from cellar to attic; the domestic load factor has improved; the illumination of rooms has in almost every case been considerably increased; and no complaints are now received as to the inefficiency of

electric lighting as compared with lighting by means of gas.

Prior to Point Five Tariffs being put into force, electricity was used for heating purposes by a number of consumers in the towns mentioned in this Report at prices varying from the ordinary lighting rates to one penny per unit, the heating medium usually being a one-kilowatt four-light radiator. Much dissatisfaction was, however, expressed at the amount of heat given off by radiators of this capacity and at the expense attached to their use. Since current has been supplied at one-halfpenny per unit, however, not only has the number of electric heaters increased to a tremendous extent, but the capacity of the individual heaters has also increased, so that capacity of the individual heaters has also increased, so that fires taking three and four kilowatts are now quite common; in fact, in several Point Five towns the three-kilowatt radiator has become a standard. The result is that instead of electric radiators being used to warm the occupants of rooms by radiant heat, the air temperature of the rooms being but little affected, the temperature of the apartments is kept practically constant throughout, and the occupants are under no necessity to remain within the direct rays of the heaters.

The Electricity Supply Undertakings under the management of the writers are both situated in industrial towns, so that the house supply load is not as important as in some areas where it is the chief source of revenue. In Bradford the units sold to private houses are only 3 per cent. of the total sales, and in Sunderland 2.6 per cent.

#### Bradford Results.

Bradford Results.

No better testimony to the popularity of the Point Five Tariff in operation in Bradford can be furnished than the fact that at the 31st December last 1,298 private house consumers were connected to the supply, whereas prior to the introduction of this method of charging on the 1st July, 1910, the number of such consumers was but 511, representing the result of nearly twenty-one years' working. It will thus be seen that during the four and a half years the Point Five Tariff has been in force the number of domestic consumers has increased by 787, or over 150 per cent. Four hundred and three, or more than half, of these consumers, have elected to be charged on the special rate, the houses being in practically all cases electrically-lighted throughout.

Of the 511 private house consumers on the supply at the 30th June, 1910, 383 have adopted the Point Five Tariff in place of the lighting flat rate of 4d, per unit under which they were previously charged. Owing to changes of tenancy and alterations in other conditions the comparison given below relates to only 138 of the consumers changed over, the periods covered being the year prior to the introduction of the Point

relates to only 158 of the consumers changed over, the periodic covered being the year prior to the introduction of the Point Five Tariff and the year ended 31st December, 1914.

Based on the total kilowatts installed the average load factor of the 138 consumers in question has increased from 3.38 per cent. to 4.34 per cent., equivalent to an increase of 28.4 per cent.

#### Units Sold for a Complete Year.

Under Gld Tariff Under Point Five Tariff Average per house under old Tariff Average per house under Point Five Tariff Increase		93,880 182,872 680 1,325 94.9 p	. <b>c.</b>

Total reve	nue			• • • •	£2,005	£1,312
Average re	venue per	house	• • •	•••	£5 18 0	£7 12 4

The particulars given below illustrate the effect the Point Five Tariff has had on the diversity factor, the periods compared being the twelve months ended 30th June, 1910, and the twelve months ended 31st December, 1914.

Twelve months ended	•••	June 30, 1910.	Dec. 31, 1914
Maximum load on L.T.		,	
feeders for residential		150	000
areas only	•••	158 KW.	290 kw.
Total kilowatts installed		4.10	0*0
in private houses	•••	420 KW.	853 KW.*
Diversity factor	•••	2.65	2.94

 This is the total for which application has been made. Ins is the total for which application has been made. It has, however, been found since the introduction of the Point Five Tariff that heating and cooking apparatus, particularly the former, has been connected in private houses to a considerable extent without the Electricity Department being notified. Consequently the figure given is very much on the low side, and this naturally reflects on the diversity factor, which is undoubtedly greater than 2.94 as stated.

In conjunction with the above table, it may be mentioned that the 420 kilowatts of consuming devices installed at the 30th June, 1910, in private houses in the residential areas dealt with were almost exclusively for lighting purposes. As at that date the number of consumers affected was 233, an average of 1.8 kilowatts per house is obtained.

At the 31st December, 1914, the consuming devices in connection with the installations in these particular areas had increased to 853 kilowatts and the number of consumers to 367, giving an average of 2.32 kilowatts per house. Of the total of 853 kilowatts connected, 545 were for lighting purposes and 308 for heating and cooking purposes, the average per house being 1.48 and 0.84 kilowatts respectively.

The annual percentage of the rateable value debited to a consumer in Bradford adopting the Point Five Tariff is 15, and it is estimated that such percentage, coupled with a

and it is estimated that such percentage, coupled with a charge of one halfpenny per unit, brings in a revenue equivalent to what would be earned for an average supply of current for lighting purposes at a flat rate of 4d, per unit. All energy required for heating and cooking purposes is under these conditions obtained at the halfpenny rate.

conditions obtained at the halfpenny rate.

Although in Bradford donestic consumers have not been approached individually for the purpose of explaining the advantages they would enjoy by changing over from the flat rate to the Point Five Tariff, more than half of such consumers have elected to be charged on the latter system, and have introduced electric heating or cooking apparatus. This is all the more remarkable when it is borne in mind that no general attempt has been made to induce consumers to install heating and cooking apparatus, the staff of the business-development department having been fully occupied in dealing with nower smolles.

development department having been fully occupied in dealing with power supplies.

In addition to this, an agreement has been in existence between the Gas and Electricity Departments that in thoroughfares in which electricity mains are already laid the Electricity Department's canvassers shall not call upon gas consumers with a view to persuading them to take an electricity supply. Furthermore, the Gas Department have been exceedingly active during the past few years in advocating the use of gas for heating and cooking purposes.

The following extract from a letter received by one of the writers from Mr. P. Collinson, the Honorary Secretary of the Bradford Branch of the Electrical Contractors' Association (Incorporated), is of interest as expressing the views of the Bradford Wiring Contractors on the Point Five Tariff in operation in that city:—

of the Bradford Wiring Contractors on the Foint rive rarm in operation in that city:—

"The Domestic Tariff is one that is popular among your consumers in that it is quite simple and easily understood; in this it differs materially from your Maximum Demand System of charging, which I find to be quite beyond the grasp of the average lay mind and which further is looked upon with some degree of suspicion.

"By enabling one set of wires to be used for both heating and lighting, the Domestic Tariff simplifies the wiring of a house and, therefore, reduces the initial cost of the installation, and by so doing tends to popularise the use of electricity. In addition to this I find that extensions of wiring are easier and not so exertly us when the house is wired in during

tion, and by so doing tends to popularise the use of electricity. In addition to this I find that extensions of wiring are easier and not so costly as when the house is wired in duplicate for both heating and lighting.

'I find that where the Domestic Tariff is in operation it is much easier to persuade the user to extend both his lighting and heating installation than is the case when the user takes his energy at the old Flat Rate; the argument that the additional load will only add so much electricity at 1d. per unit to his bill usually proves irresistible. The large increase in the number of radiators installed in Bradford during the past few years is undoubtedly a direct result of the Domestic Tariff, and I believe that it is only under this system of charging that electric cooking will make appreciable headway.

"Looking at the Domestic Tariff from a Contractor's point of view, I am satisfied that it is a system of charging which makes for increased business, and as it appears to give satisfaction to the user, it has my emphatic approval, coupled with the hope that the principle may, at an early date, be extended to those of your consumers who are occupiers of shop, warehouse, and other business premises, and who are at the moment excluded from the scope of this tariff.

"In conclusion I may add that the opinions expressed in this letter are not my personal opinions only, but are the opinions of the bulk of my conferers in this city."

#### SUNDERLAND RESULTS.

At the introduction of the Point Five Tariff there were 337 private houses connected to the supply, the majority partially lighted only, as the result of sixteen years' working. Since the tariff was introduced upon the 1st of January, 1912, three years' working has resulted in 162 more private houses being connected; 100 of these elected to be put on the Point Five Tariff and are lighted throughout, and 62 upon a flat rate of 3.6d per unit.

Five Tariff and are lighted throughout, and 62 upon a flat rate of 3.6d. per unit.

Of the 337 houses that were on the supply at the 1st January, 1912, 105 have changed over from a flat rate of 3.6d. per unit to the Point Five Tariff, and of these 105 houses have, owing to there being no change of tenancy, been taken for the following comparison, the periods being the year preceding and the year following the adoption of the Point Five Tariff:—

The average of companions lead for the following of companions lead for the following the adoption of the Point Five Tariff:—

The average of consumers' load factor on kilowatts installed has been increased from 2.44 per cent. to 4.05 per cent., an increase of 66 per cent.

... \$10,000 ... 92,960 ... 330 } £103,290 o per cent. debentures ... Ordinary shares. £5 fully paid ... Founders' shares, 66 of £5 each...

Ordinary shares, 26 fully paid ... ... 92,950 £103,290

The E.P.S. Co., as already announced, will go into liquidation, and the Pritchetts & Gold, Ltd., will change its name to that given at the head of this article. It will also increase its capital and alter the status of the shares. A further 20,000 5 per cent. preference shares of £1 each will be registered; and the existing 20,000 ordinary shares will become ordinary "A" shares, noncumulative, and entitled to a dividend of 15 per cent. There are also to be created 20,000 "B" ordinary shares of £1 each, noncumulative; 14,000 1s. deferred shares (£700); also 5 per cent, first mortgage debentures of a total not exceeding £20,000.

The terms of purchase are: £10,000 debentures, 18,658 ordinary "B" shares, and 4,000 deferred shares. The balance of the purchase consideration being dependent upon the valuation of stockin-trade, &c., at the end of the year (June 30th), cannot yet be stated, but it is to be paid either in preference shares or in debentures, but not exceeding £10,000 in debentures, making the total thereof £20,000. The E.P.S. Co. will take 4,000 of the 1s. deferred shares, leaving 10,000 to be subscribed for by the present ordinary shareholders of Pritchetts & Gold, Ltd. The proportion of profit will thus be five-sevenths to the shareholders of Pritchetts & Gold, and two-sevenths to the shareholders of the E.P.S. Co.

R.P.S. Co.

In regard to directors, the boards of the two concerns will be amalgamated. Mr. G. E. B. Pritchett will continue in the chairmanship, and Mr. James Gray will be deputy-chairman. The other directors will be:—Sir James Pender, and Mesers. A. G. Gold, F. C. Graham Menzies, T. W. Pritchett, C. R. D. Pritchett, and David Willock. Mesers. G. E. B., T. W., and C. R. D. Pritchett will continue to act as managing directors. The principal members of the E.P.S. works and scretarial staffs will hold office under the amalgamated concern. The E.P.S. works at Milwall will be closed as soon as is practicable, and the works of Pritchetts and Gold, at Dagenham Dock, which have only been working for a year, and are laid out on most modern lines, are being much enlarged so as to accommodate the operations of the two businesses. The company has four acres of land there. It is interesting to note that the company, which has hitherto taken its supply of energy from outside sources, is now building a power-house of its own from outside sources, is now building a power-house of its own which will render it both independent and able to deal with the greatly increased power demand that the larger business to be handled will involve. The offices of the E.P.S. Co., at 4, Great Winohester Street, E.C., and those of Pritchetts & Gold, Ltd., at 58, Victoria Street, S.W., will be closed at the end of the month, and the company's efficience of the supply of energy to the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the supply of the sup and the company's office operations (estimating, secretarial and general business, in fact everything excepting actual manufacturing) will be concentrated at new offices situated at 82, Victoria

Street, S.W.

The amalgamation of two well-known English battery manufacturing concerns is an event of no small interest to the electrical industry. "E.P.S." are household letters known all over the world—many electrical men learned them as part of their professional alphabet long years ago—and they will not now disappear. Pritchetts & Gold, too, is a popular name among engineers and battery users generally. It is nearly 30 years since Mr. G. E. B. Pritchett first began the manufacture of batteries. In 1890 his Pritchett first began the manufacture of batteries. In 1890 his work was continued under the name of Pritchett Bros., and in 1892 as Pritchetts & Gold, at Woolwich. Five years later the business was removed to Feltham, and in 1901 the concern was formed into a limited liability company as Pritchetts & Gold, Ltd. Thirty years ago the late Mr. G. E. Pritchett—father of the three gentlemen who have enterprisingly built up the business now in mind—showed, though not an electrical engineer, a very keen appreciation of, and belief in, electrical matters when he founded, in conjunction with his son Mr. engineer, a very keen appreciation of, and belief in, electrical matters when he founded, in conjunction with his son, Mr. G. E. B. Pritchett, the business of G. E. Pritchett and Co., which owned an electric light station at Blackhorse Yard, Rathbone Place—which is now a part of the Marylebone electric supply system. To his sons, in conjunction with those who have been closely identified with the operations of the Electrical Power Storage Co., Ltd., it has now fallen to carry through a business operation which indicates a keen appreciation of future possibilities, and augurs well for economical and other wise successful manufacture along lines which will ensure for the amalgamated concern a leadalong lines which will ensure for the amalgamated concern a leading place among the battery makers of the United Kingdom, and will enable it to make a good stand against foreign competition in all parts of the world when things industrial begin to return to the normal—if they ever do so.

### BUSINESS NOTES.

Advance in Prices.—Messrs. Kelvin, Bottomley AND BAIRD, LTD., of Glasgow, announce that owing to the recent rise in cost of both material and labour, due to the present war conditions, they are compelled to increase all prices by 10 per cent. as from June 1st. The new prices are present list prices less schedule discounts, plus 10 per cent. advance.

Private Arrangements,-A. C. BIRD, general and electrical engineer, 22, Regent Street, Hinckley.—The creditors interested herein were called together recently, when a statement of affairs was submitted which showed liabilities of £920, all of which was due to unsecured creditors. The assets were estimated to realise £422, from which had to be deducted £17 for preferential to realise £422, from which had to be deducted £17 for preferential claims, leaving net assets of £105, or a deficiency of £515. It was reported that the debtor started the present business a little more than a year ago. Prior to that date he had been in partnership with another man. He had little or no capital when he started the present business. The liabilities included cash claims of £214, while the bank were creditors for £172. The bank held a guarantee for £100. In consequence of pressing creditors, a deed of assignment had already been executed with Mr. Millman, I.A., Leicester, as trustee. The creditors, after a short discussion, decided to confirm the deed already executed. firm the deed already executed.

Catalogues and Lists.—Messrs. Drake & Gorham, LTD., 1, Felix Street, Westminster Bridge Road, London, S.E.-8-page illustrated pamphlet (No. 233) giving prices and particulars of their "Phoenix" electric fans, including desk, oscillating, ceiling, porthole, and box-blade types.

BRITISH THOMSON-HOUSTON Co., LTD., Rugby. — Descriptive list No. 6,500 (20 pages) giving very full particulars with illustrations of their steam, water and air-flow meters of various types,

their principle, construction and installation.

MESSES. BRITISH INSULATED & HELSBY CABLES, LTD., Prescot.

MESSES. BRITISH INSULATED & HELSBY CABLES, LTD., Prescot.—4-page illustrated and priced circular giving particulars of the Prescot twin house-wiring system (cables and joint-boxes).

MESSES. J. H. HOLMES & CO., Newcastle-on-Tyne,—Illustrated pamphlet No. 73, describing their cellular type switchboards (2,000—6,600 voits, A.C.); also single units for controlling the H.T. side of motor-generator and independent exciter control pillare.

STERLING TELEPHONE AND ELECTRIC CO., LTD. 210-212, Tottenham Court Road, London, W.—Publication No. 223, giving illustrated particulars and prices of their "Equipoise" telephone arm; also illustrated price-sheet of loud single-stroke bells for railways. mines. &c. railways, mines, &c.

Electric Vehicles.—The latest addition to the list of manufacturers of electric motor vehicles is ELECTROMOBILE (LEEDS), LTD., whose works are at 32, Neville Street, Leeds. Pleasure cars as well as industrial vehicles, with carrying capacities ranging from 7 cwt. to 5 tons, are being turned out.

Electric Clocks .- THE SYNCHRONOME Co., LTD., state Electric Clocks.—The Synchronome Co., Ltd., state that the industry of electric clockmaking has felt the pressure of war time, and this has made it easier for them to spare no less than 50 per cent. of their staff, who are now serving H.M. Forces in some capacity or another. Rapid extensions of their circuits of electrical impulse dials have, however, been required in munition factories and shipyards, and in many buildings now used as war hospitals. They are also extending the electric time circuits in Euston station for the L. & N.W. Ry. Co., at Waterloo for the L. & S.W. Ry., and at Port Sunlight for Lever Bros., Ltd., and providing new installations of electric clocks in the Civil Service Commission, Burlington House, for the Office of Works; the new offices of the Western Union Telegraph Co., Ltd.; Messrs. Pilkington's Glass Works, St. Helens, &c.

Bankruptcy Proceedings. — DENIS R. BROADBENT, 50, Hans Place, Chelsea.—The first meeting of creditors was held 50, Hans Place, Unclessa.—The first meeting of creditors was need on Monday at the London Bankruptcy Court under this failure. Mr. E. Leadam Hough, Senior Official Receiver, reported that it appeared from the debtor's statements that he qualified as an electrical engineer in or about 1890, but had never carried on business on his own account. When he came of age he became oftitled to about \$5.000 under the will of a relative and had lost entitled to about £5,000 under the will of a relative, and had lost entitled to about \$5,000 under the will of a relative, and had lost it all in investments in certain public companies. In 1900 he formed the British Electrical Manufacturing Co., Ltd., with registered offices at 37, Walbrook, E.C., and works at Putney Bridge Railway Arches. The object of the company was to purchase from the debtor, as a going concern, the business of J. D. F. Andrews & Co., Ltd., electrical engineers, which he had at that time purchased with his own money for £2,500, The nominal capital of the company was £10,000 in preference and ordinary shares. Under his agreement with the company the debtor received, in consideration of the transfer of the business, £2,000 4 per cent. debentures, 250 preference and certain ordinary shares. He was appointed director at £4 per week, inclusive of fees. He subsequently put a further £500 into the company, but about two years after its formation the company went into voluntary liquidation, and the debtor altogether lost £3,000 in the concern. In 1905 he purchased £200 worth of shares, and subsequently a further £200 worth, in the Deuxphone Manufacturing Co., Ltd., of Newton Abbot. That company carried on business for about two years and then went into voluntary liquidation, the debtor losing the £400 he had invested in it. He had been interested as director or otherwise in a number of other companies, over which he lost money, and no statement of affairs had been lodged, but the debtor roughly estimated his liabilities at £1,370, and did not admit insolvency. The meeting was adjourned.

A. WHITELEY, electrical and mechanical engineer, Llaududno.— A first and final dividend of 63, 10½d. in the & is payable on June 25th, at the Official Receiver's office, Crypt Chambers, East-

gate Row, Chester.

Liquidation. — PINTSCH'S ELECTRIC MANUFACTURING Co., LTD.—This company is winding up voluntarity, with Mr. H. W. Kirby, of Bassishaw House, Basinghall Street, E.C., as liquidator.

For Sale.—Bolton Corporation has for disposal four 270-H.P. engines; four 200 kw. Ferranti single-phase, 83 cycle alternators, 2,000-2,200 v.; three 30 ft. by 7 ft. 6 in. Lancashire boilers and superheaters. Particulars are given in our advertisement pages.

Trade Announcement.—Messrs. J. P. Strange and P. G. Hobbs, trading as the ELECTRICAL INSTALLATION Co., of 42, Monson Road, Tunbridge Wells, give notice that, having been called up for service in H.M. Forces, they find it necessary, at any rate temporarily, to close their business. They have appointed Mr. Percy Wickenden, chartered accountant, 1 and 2, The Broadway, Tunbridge Wells, receiver of the partnership assets, to whom all accounts should be sent for payment.

Catalogues Wanted,—Mr. E. Pogson, who has recently taken charge of the electric power installation at Ripon Camp, invites manufacturers to send him catalogues of engine-room stores, overhead-line material, switches, fuses, meters, cables, lamps, &c.

# LIGHTING and POWER NOTES.

Argentina.—The first electric furnace in South America is about to be installed at Buenos Ayres. It will, says La Electricidad y la Maquinaria, be capable of smelting metals on a large scale, and will be installed in "our laboratory," presumably that of the Instituto Sudamericano de Electricistas y Mecanicos, of which that paper is the official organ.

Ashton-under-Lyne, — Street Lighting. — The restrictions on public lighting have been relaxed, but it is not considered desirable to go back to are lighting, as the half-watt lamps which have been introduced give twice the light at half the cost.

Barnsley.—Year's Working, &c.—The electricity department made a profit on the year's working of £1,115, which it was decided to carry to reserve account. The Works Sub-Committee has decided to increase the wages of stokers and drivers employed at the electricity works from May 20th, overtime to be paid for in future in accordance with local conditions and all broken time to be stopped, and no further payments to be made during absence through ill-health. The Electricity Committee has decided, owing to the increased price of coal, increased cost of labour, &c, to raise the price for current as from July 1st, 1915, by 1½d. per unit for lighting purposes, and by 15 per cent. for power purposes. The coal contracts for the next 12 months had recently been let at an advanced price of £2,400.

Barton-on-Humber,—RESTRICTED LIGHTING. — On account of the suspension of street lighting the Electric Supply Association has agreed to forego half the balance of the sum due for the year on account of public lighting.

Beckenham.—PRICE INCREASE.—On account of the enormous increase in the price of coal, and the advance in the cost of materials and wages, the U.D.O. has decided to increase the price of current for the ensuing quarter by 15 per cent.

Berwick-on-Tweed.—The T.C. has decided to have the Council Chamber lighted by electricity, and has accepted the offer of the Electric Supply Co. to fix four ceiling fittings with 100 c.p. lamps.

Bidford-on-Avon.—E.L. SCHEME.—After considering a proposal by Messrs. Pullan & Best, of Bradford, to provide an E.L. installation for the district through a local company to be formed, the P.C. has passed a resolution stating that it is favourable to the proposed scheme.

Bispham.—The working of the Council's electricity undertaking for the year ended March, 1915, shows a deficit of £399, as against £616 in 1914. The estimated deficit for 1916 is £650.

Bradford.—L.G.B. INQUIRY.—Last week an inquiry was held into the application of the Corporation for sanction to borrow £2,977 for the reconstruction of cells at the destructor works, Sunbridge Road.

Carnaryon.—The Electricity Committee reports that as the result of further representations, the L.G.B. has agreed to consider the application for borrowing powers for the extension to Bryn Sciont.

Chesterfield. — PLANT EXTENSIONS. — The T.C. has received a letter from the Chesterfield Tube Co. stating that, as the Corporation was meeting the present demand for power, it did not consider that the expenditure of the £5,000 which the Corporation found necessary need be undertaken on its account alone. The Council has decided to purchase an alternator, boiler, superheater, mechanical stoker and economiser, at a total cost of £2,706, and it was stated that it was hoped in the near future to complete the scheme which the Electrical Committee brought forward in February, 1914.—Nottingham Guardian.

Continental. — France. — Work has recently been completed on the new hydro-electric power plant near Bramia, in the Valley of the Rhone, for the Socié é d'Aluminium de Neuhausem. The water power of the River Borgne is utilised, the water being taken in the Eriny Valley and piped to Bix, whence to the power plant—which is equipped with turbines of a total capacity of 30,000 H.P.—a fall of nearly 400 ft, is obtained. The current generated is being used in the Neuhausen Co.'s works at Chippis, where a total of no less than 100,000 H.P. is now available.

Darwell,—INGREASED PRICES.—The Corporation has decided to increase the charges for electricity for public and private lighting by 10 per cent., and for power purposes by 20 per cent., apart from sealed contracts and tramways.

Great Harwood,—E.L. SCHEME.—The proposed electricity scheme has been deferred in consequence of the war. Application is to be made to the B. of T. for a renewal of the Electric Lighting Order.

High Wycombe.—PRICE INCREASE.—The Electricity Co. has increased the price of current for power, lighting and heating by 10 per cent. as from July 1st.

Hexham.—INCREASED PRICES.—The Hexham and District Electric Supply Co., Ltd., has given notice that the charge for current for lighting purposes will be increased from 5d. to 6d. per unit from July 1st; terms, discounts, &c., remain unaltered.—Newcastle Daily Journal.

**Heywood.**—Loan Periods.—The L.G.B. is to be asked to fix an equated period for the borrowing of £6,355, sanctioned on March 26th last, for the electricity undertaking.

Ilford.—The proposed new tariffs have been referred to a small sub-Committee to consider in detail and report. The Electricity Committee has deferred, for the present, a report of the electrical engineer on the question of providing mechanical stokers for two boilers at the works. The electrical engineer is in communication with a firm of accumulator manufacturers respecting a supply of current for their projected new works.

Kilkeel (Co. Down),—PROPOSED E.L.—The Council has decided to apply to the Irish L.G.B. for powers for the electric lighting of the town.

King's Lynn.—Year's Working.—The annual accounts of the Council's electricity undertaking for the 12 months ended March 31st last show that the income amounted to £7,992, as against £8,519 in 1914; the expenditure was £6,642, as compared with £6,742 in the previous year, leaving a profit of £1,350, as against £1,776. It was decided that the whole of the surplus should be applied in reduction of capital money borrowed for electricity purposes. The total number of units sold was 615,803, as compared with 669,874, and the average price obtained was 2.76d. per unit, as against 2.66d. The Electricity Committee has decided to reduce the charge for public lighting for the year by £300, owing to the restricted lighting.

Kirkcaldy,—Financial Estimates.—The Corporation Electric Lighting and Tramway Committee has submitted the estimates for the ensuing year. Owing to the rise in the price of coal, the deficiency in the electricity department is estimated at about £3,000, to meet which it has been decided to increase the price charged for private lighting and power by 25 per cent., and for tramway supply by \( \frac{1}{2} \)d. per unit. To meet the less on the tramways it was decided to abolish all overlapping of \( \frac{1}{2} \)d. stages.

Long Eaton.—ELECTRICITY CHARGES.—The following revised scale of charges for current has been adopted by the U.D.C.:—Domestic lighting, 4d. per unit, less 5 per cent.; factories, 3\ddots, per unit for the first 2,000, and 2\ddots depond; public lighting, 2d., less 5 per cent.; power, 1\ddots depond, less 5 per cent.; heating and cooking, 1d., less 5 per cent.

Linton.—Workhouse Lighting.—Owing to the heavy rates payable to the County Council, the Board of Guardians has decided that it cannot incur the expense of the proposed electrical installation at the workhouse premises.

London.—Fulham.—The linking-up scheme of the boroughs of Battersea, Hammersmith, and Fulham provides for the laying of connecting mains between the generating stations, and the provision of suitable transforming plants at each station. The cost of the mains and their maintenance is to be shared equally by the three Councils, the work to be carried out under the supervision of the Fulham Council. Each Council will bear the cost of its own transformer station and transforming plant. the cost of its own transformer station and transforming plant. It is proposed that the agreement giving effect to the scheme shall be for a period of 25 years, and that each Council shall extend its plant, in rotation, as and when the combined generating plant is insufficient to meet the combined maximum demand in the three areas of supply concerned, Fulham to be the last to extend. The charges to be made have been provisionally agreed and are mutual, and subject to revision every five years. The estimated cost of the connecting mains is £17,441, of which the Fulham Council will be responsible for one-third or £5,813, and the estimated cost of providing the transformer room and transforming, &c., plant at the Townmead Road station is £2,562, making a total of £8,376. It is anticipated that only part of the connecting mains provided for in the above estimate will be laid in the first instance. The Electricity Committee recommends the Council to approve the scheme subject to the agreement being approved by the Law and Parliamentary Committee, and that application be made to the Board of Trade and the L.C.C. for ranction to its adoption, and to the Treasury for canction to the necessary loan to carry out the work. necessary loan to carry out the work.

WOOLWICH.—An agreement has been sealed with the Secretary

for War for the supply of electricity to the Bostall Heath Camp. The Electricity Committee reports that, up to the present time, no meter rents have been charged to customers, except in special circumstances. Having regard to the fact that it often happens that more than one meter is required in a private house, and two or more, per service, in a business house, it has been decided to charge is. 6d. per quarter for additional meters when more than

one is required for a private house service, and more than two are required for services to business premises.

MARYLEBONE.—The B.C.'s Finance Committee recommends application to the L.G. B. for sanction to a loan of £5,450, to cover

application to the LGB. for sanction to a loan of £5,450, to cover expenditure on mains, including this year's expenditure.

The E.L. Committee has arranged suitable accommodation for, and come to an agreement with, Edison Accumulators, Ltd., whereby the latter for five years will carry out the charging of all vehicles brought to the Council. The company agrees to take 100,000 units during the first year, and not less than 250,000 units a year subsequently, excluding energy used at premises other than the generating station, Blandford Street and Bathbone Place. The prices quoted by the Council vary from ½d. to ¾d per unit.

HAMMERSMITH.—The Electricity Committee in reporting on the proposed linking up scheme with Filham and Battersea B.C.'s., points out that the Battersea B.C. must meet certain large additional demands for electricity in the immediate future, and this can only be done, the Committee is informed, by an extension of the Battersea existing station or by putting into operation at an early date the proposed linking-up scheme.

early date the proposed linking up scheme.

The Committee recommends approval in principle of the scheme subject to the necessary consents being obtained and to a satisfactory agreement being entered into.

Market Drayton.—Public Lighting.—The U.D.C. has decided to sek the local Electric Lighting Co. for its terms for lighting High Street and Shropshire Street, and converting the lamps.

Melton Mowbray.—The Electricity Co. has applied to the B. of T. for permission to use 200-volt overhead lines in the town.

Middlesbrough.—The L.G.B. has sanctioned borrowing powers to cover expenditure for laying electricity mains to works engaged on making munitions, but not for supplying electricity to ordinary consumers.

Rawdon.—E L. SCHEME.—The D.C., after considering the report of the conference of the local Wharfedale authorities regarding the provision of electricity for the district, has decided not to join in the scheme.

Restricted Lighting.—The following additional regulations regarding lighting appeared in the London Gazette:

scretary of State may order that all lights shall be extinguished or obscured between any hours, and within any area, and if no police constable is available to see that the order is obeyed, "any soldier or sailor on sentry patrol, or other similar duty," may enter premises, or stop and seize any vehicle to extinguish or obscure the lights.

No coloured lamp may be carried on any vehicle other than a locomotive or railway carriage without lawful authority, unless such light is already authorised by law. Lights carried in vehicles are not to be capable of movement "independent of the movement are not to be capable of movement."

of the vehicle.

St. Annes-on-Sea.—Price Increase.—The U.D.C. has decided to increase the price of electricity for private lighting by one halfpenny per unit, and to add 10 per cent, to the price of current for all other purposes except cooking.

Salford.—Proposed New Plant.—The question of the supply of a 5,000-KW, turbo-alternator at the Frederick Road electricity station, at an estimated cost of £16,200, is under consideration.

Sheerness.—L.G.B. Inquiry.—An inquiry was held on June 8th into the application of the U.D.C. for a loan of £5,000 for the extension of the refuse destructor. There was no opposition.

Shipley.—Price Increase.—From July 1st the charge for electricity for lighting purposes will be 41d. per unit, and for power purposes the present charges are to be increased 10 per cent.

Slaithwaite.—E.L. Scheme.—The Council has decided, owing to the fact that the L.G.B. has intimated that it is not prepared to sanction any loans for public works during the war, and on account of the abnormally high prices of labour and materials, that the electric lighting scheme for the district should be temporarily suspended.

Stratford-on-Avon.—The Electricity Co. has asked the T.C., in view of the increased cost of coal, labour, &c., to allow as per an agreement with the Corporation, although it was proposed at present to charge consumers only 5½d. The Council has referred the matter to a Committee, who will go into the agreement and report.

Teignmouth.—Prov. Order.—The B. of T. has issued a prov. order for E.L. to Mesers. J. W. and A. Purves, and the U.D.C. has decided not to oppose the confirming Act.

United States.—The Daily Chronicle's New York correspondent says a wide conspiracy exists to destroy plants in event of trouble between Germany and America, and the American Government has warned munition manufacturers to have their factories heavily guarded. Some have already electrically-charged wire fences 6 ft. high erected around them.

-The accounts of the Walsall.—YEAR'S WORKING.-Corporation electricity undertaking show a profit of £1,385 a sum of £1,012 is transferred in respect of obsolete plant. The Electricity Committee recommends that this profit should be applied in reducing the debt on switchgear and plant to be superseded on the completion of the new station, and also to carry forward £639.

forward £639.

NEW POWER STATION.—In view of the slow progress at the Birchills power house, together with other circumstances consequent upon the dislocation caused by the war, the Electricity Committee has considered the question of how to meet the demand during the coming winter, in the event of the new plant not being ready. The Committee has decided that no further plant not being ready. The Committee has decided tha plant be provided at the Wolverhampton Street works.

Warminster.—E.L. Scheme.—Mr. J. H. Edwards, promoter of the E.L. scheme, has informed the U.D.C. that the parties interested in the matter are not able at present to decide definitely as to the site for the generating station, and are unwilling to bind themselves in any way at the present time.

Watford.—Price Increase.—The U.D.C. has, owing to the enormous increase in the price of coal, advanced the price of current for lighting by 12½ per cent., and for power, &c., by 10 per

Wimbledon.—In regard to the B.C.'s application for permission to supply electricity to 18 houses in the parish of Cuddington, and in the Epsom Rural District, the B. of T. is not prepared to make an order under the section in respect of such a large number of premises, and suggests that the Corporation should apply for a prov. order to extend its present area of supply.

Yarmouth.—YEAR'S WORKING.—The annual accounts of the Corporation Electricity Department for the year ended March 31st, 1915, show a gross profit of £9,250. After payment of interest and oustanding charges of £8,630, £188, the final instalment of the cost of the mechanical stokers and the alteration of the system of street lighting, there was a net profit of £432, which was carried to the appropriation account.

The Electricity Committee has reduced by one-third the charge

of £591 for street lighting.

# TRAMWAY and RAILWAY NOTES.

Aberdeen.—YEAR'S WORKING.—The total revenue for the past year of the Corporation tramways was £87,986, and the increase, as compared with 1913-14, was £2,722. The number of passengers carried was 22,866,761, as against 20,966,304, an increase of 1,900,367, allowance being made for soldiers' free tokens. The miles run numbered 1,907,377, against 1,832,587.

Bolton.—In connection with the movement of local tramway workers to secure advances of wages, the men have decided to ask the Tramways Committee to grant an advance of a  $\frac{1}{4}$ d. an hour in July, and a further  $\frac{1}{4}$ d. on January 1st next.

Bolivia.—According to information published by the newspapers of Bolivia, the construction works will shortly be taken in hand of the electric tramway from Yungas to La Paz.

Continental.—ITALY.—A concession has lately been granted for the construction and working of an electric tramway between Turin, Sassi and Superga.

Dartford.-Messrs. Balfour, Beatty & Co., Ltd., have applied to the B. of T. for the time for the completion of the tramways under the 1911 order, to be prolonged until August 18th, 1918.

On the advice of the engineer-in-chief, the Metropolitan Asylums Board has approved of the installation of certain points and crossings for a projected siding of the tramway system at the

Joyce Green Hospital.

Hove.—RAILLESS TRACTION.—The T.C. is recommended to agree to an extension of time for completion of the through railless system until two years after the termination of the present war, and that the conditions resulting from the Brighton and Hove Acts of 1912 be extended over the period named.

London.—The L.C.C. Highways Committee is giving careful consideration to the case of those employés who remained loyal during the strike. During the four weeks ended June 2nd, the number of passengers carried was 25,789,651, as against 42,025,436 in 1914, a decrease of 16,235,785. Traffic receipts amounted to £109,547, as compared with £178,848, showing a decrease of £69,301.

The Select Committee of the House of Commons has passed the L.C.C. scheme for extending the existing tramways from the Aldgate terminus, down Mansell Street, and across Tower Bridge approach to Tower Hill, terminating by a loop round Trinity

Square.

The Highways Committee recommends that the arrangement made in July, 1913, that any surplus from the working of the Council's tramways should be paid into the renewal fund, be extended for a further period of two years from April 1st, 1915; also that the basis of the provision to be made be reconsidered at the end of that period.

Quarry Bank .- The Quarry Bank and District Light Quarry Bank.—The Quarry Bank and District Light Railways (Transfer) Order, 1912, expires in August, and Messrs. Balfour, Beatty & Co. have informed the U.D.C. that circumstances have rendered it impossible for them to proceed with the scheme, and that in view of present conditions it is inadvisable to apply for an extension of time in view of the unlikelihood of them being able to deal with the matter in the future. The Council has referred the matter to the Brierley Hill, Quarry Bank and Rowley Regis Light Railways Joint Committee.

Northampton .- YEAR'S WORKING .- The accounts of the Corporation tramway undertaking for the year ended March 31st show that after the payment of interest and instalment of loans there was a credit balance of £1,581, of which £651 has been placed to the reserve fund. The sum of £5,000 is to be debited to the reserve fund, now standing at £11,420, and credited to the unexpired loans for the original Kingsthorpe system prior to the Kingsthorpe and Far Internations. Kingsthorpe and Far Cotton extensions.

Sunderland.—The reserve, renewals and compensation funds of the tramways department now amount to £45,044, the sum of £4,064 having been added during the year. There has been a falling off in the receipts during the last two months of £503, equal approximately to £3,018 per annum. Altogether 83 of the employés have left to join the military or naval service or to engage

Tottenham.—It has been suggested that the D.C. should enter into an agreement with the Metropolitan Electric Tramways, Ltd., as to the repair and maintenance of the tracks in Tottenham under the jurisdiction of the company. The General Purposes Committee of the Council has instructed the clerk to negotiate with the Tramways Co accordingly.

Walsall.—The Corporation Tramways recommends the purchase for £900 of land adjacent to the Corporation tramways depôt from the Birchall's Estate Co., as a site for a depôt for the motor-'bus service.

Tarmouth.—YEAR'S WORKING.—The report of the Corporation tramway undertaking for the year ended March 31st last, shows a gross profit of £5,706, as compared with £8,631 in the previous year; loan charges, &c., amounted to £7,041, leaving a deficiency of £1,294.

# TELEGRAPH and TELEPHONE NOTES.

Adriatic Cables Cut.—On June 5th the cables uniting the Continent to the islands of the Dalmatian Archipelago were cut by the Italian Navy.

Argentina.—A new company which has just acquired the generating station at Jujuy intends to reconstruct and extend the telephone network in that province. The capital town is to be placed in communication with the departments to the east and west. affording connection with Perico del Carmen, San Pedro and Lodesma

France (Algeria).—The Chamber of Commerce of Algiers has been authorised to lend a sum of £2,976 to the Government-General of Algiers, in order to establish a telephone system between Warnier, Malakoff, Masséna, Lamartine, Beni-Indel and Bou-Caid.—B. of T. Journal.

Illicit Wireless,—A school teacher named W. R. Walker was charged at Castle Eden Police Court, Durham County, on was charged at Castle Eden Police Court, Durham County, on Saturday last, with being in possession of wireless telegraphic apparatus at Trimdon Grauge. The defendant, who had informed the Post Office in August last that he had wireless apparatus (which was dismantled at the outbreak of the war), was fined £5 5s.

## CONTRACTS OPEN and CLOSED.

#### OPEN.

Australia.—Melbourne:—Aug. 11th. One 1,000-kw. o.c. generator complete, liquid starter, &c., for City Council. See 'Official Notices' June 4th.

ADELAIDE. — July 14th. Galvanised-iron wire, for P.M.G.'s Department. See "Official Notices" June 4th.

SYDNEY.—July 19th. City Council. Fuses and fuse-boxes. City Electrical Engineer (10s. 6d.).

Basingstoke.—Installation of electrical plant, including engines, dynamo, battery, cables, &c., at Park Prewett Asylum. See "Official Notices" to-day.

Bolton. — June 23rd. Corporation. 30,000 tons of bituminous engine slack, nuts, or peas, for the Electricity Committee. Forms of tender from Mr. W. J. H. Wood, Borough Electrical Engineer.

Brighton.—June 22nd. Electrical fittings, for the Board of Guardians. Particulars from Mr. H. Burfield, Clerk, Princes

Dublin.—June 21st. Installation of electric light at the Technical Schools, Rutland Square, for the Education Committee. Particulars from Mr. J. Clark, Technical Institute, Bolton Street.

Eastbourne,-June 26th. 160 ft. of 14-in. cast-iron circulating water piping and valves. See "Official Notices June 11th

Edinburgh.-June 21st. Two 5,000-kw. turbo-alternators and condensing plant, for Portobello supply station. See "Official Notices" May 21st.

-July 5th and 19th. U.D.C. One water-tube boiler with superheater, economiser, automatic stoker, steel chimney, induced-draught plant, steam valves, steam pipes, and all auxiliaries. One 2,000-kw., H.P. turbo-alternator, with condensing plant, switchgear, and all accessories. See "Official Notices" to-day.

Exminster.—June 29th. Electrical appliances for a year, for Devon County Lunatic Asylum. Mr. H. E. Morgan, Clerk.

Glasgow.—June 19th. School Board. Installation of electric light at Springbank Public School, Henshaw Street. Specification from the School Board offices, 129, Bath Street.

-July 1st. Corporation. One 5,000-KW. turbo-siternator complete with condenser; two natural-draught chimney-type cooling towers; one water-tube boiler, superheater and mechanical stokers. See "Official Notices" to-day.

London. — Metropolitan Asylums Board. -30th. Lighting installation at the Grove Fever Hospital, Tooting Graveney, S.W. See "Official Notices" June 11th.

FULHAM.—June 30th. 11,000 tons of coal, for the Borough Electricity Works. See "Official Notices" June 11th.

Nottingham.—June 24th. Twelve months' supply of coal for the Corporation generating stations. Mr. H. Talbot, Electrical Engineer.

Rangoon.—August 11th. Installation of a system of fire-alarme for the municipality. Specification (10a.) from Mesers. Ogilvy, Gillanders & Co., 67, Cornhill, E.C.

Rochford.—The B. of G. is recommended to invite tenders for the installation of a system of electric bells, indicators, &c., at the infirmary.

Salford.—June 28th. Supply of stores, including cable, &c., for the Electricity Department. See "Official Notices" to-day.

Spain.—The Spanish Ministry of Posts and Telegraphs, Madrid, is inviting tenders for the establishment and working, during a period of 20 years, of telephone exchanges in the towns of Monforte de Lemches (Province of Lugo), Guadix (Granada), Betanzos (Coruna), Durango (Vizzaya), Cabeza de Buey (Badajoz), Ilaro (Logrono), Tudela (Pamplona), Vinaroz (Castellon), and

Haro (Logrono), Tudela (Pamplona), Vinaroz (Castellon), and Baza (Granada).

Tenders have lately been invited by the municipal authorities of Pinille del Toro (Province of Zamora) for the concession for the electric lighting of the town.

July 31st. The Spanish Ministry of Public Works in Madrid is inviting tenders for the concession for the construction and working of an electric tramway between Mongat and Tiana (Province of Barcelona). An application has already been made for the concession, but, in accordance with the usual custom in Spain, the project is being put up to public tender. Spain, the project is being put up to public tender.

Tasmania. — Launceston. — July 26th. Sub-station equipment. Section I, Converter machine, switchgear, &c.; Section II, Underground feeder cable. Specification (21s.) from the City Electrical Engineer, Town Hall.

Walsall and West Bromwich.—July 5th. Lighting; heating apparatus; drainage and septic tanks, for Unions Joint Committee. See "Official Notices" to-day.

Warrington.—June 18th. E.H.T. cable, for Electricity and Tramways Committee. See "Official Notices" June 11th.

Wigan. — June 21st. Corporation. Two water-tube boilers with mechanical stokers. See "Official Notices" June 11th.

#### CLOSED.

Australia.—Sydney.—According to the Sydney Sun, the City Council received the following tenders:-

the City Council received the following tenders:—

Incandescent lamps.—

Aust. General Electric Co.—Vacuum, £888-15s.; nitrogen, £3-15s. 3d.

Do. do.—Alternative A: Vacuum, £918-15s.

Lawrence & Hanson.—Vacuum, £957-5s. 10d.; nitrogen, £2-12s.

British General Electric Co.—Vacuum, £1,119-10s.

Aust. General Electric Co.—Vacuum, £1,843-1fs.

British General Electric Co.—Vacuum, £1,843-1fs.

British General Electric Co.—Vacuum, £1,843-1fs.

College State of the Co. Stander recommended for acceptance for vacuum lamps: Aust. General Electric Co.'s tender for nitrogen lamps recommended for acceptance.

Coal schutes.—

Coal schutes.—

W. Elder & Co. . . . £2°0 | Watt & Murdoch . . £

Storey & Keers . . . 812 | James Councily

W. Elder & Co.'s tender recommended for acceptance.

The following contracts have been placed:

N.S.W. Railways and Tramways Department.

Quadruple turntable for White Bay power house, £549.—H. Vale & Sons.

Metropolitan Board of Water Supply, Sydney, annual contracts.—

Electrical conduit.—W. G. Watson & Co., Ltd., 823 per cent. below schedule.

Electrical sundries.—Lawrence & Hanson Electrical Co., Ltd., 15 per cent. below schedule.

Electrical wires and eables:—W. T. Henley's Telegraph Works Co., Ltd., 73 per cent. below schedule.

Bouth Gippsland (Vic.) Creamery & Butter Factory, Ltd.—

Generator, three-machine booster, switchboard, 140 amp. hour Chloride battery of 125 cells, cables, vo., £751.—Sutherland & Ashman.

—Tenders.

Barnet.-In connection with the installation of electric light at the Nursery, the Guardians have accepted the tender of Messrs. Barter & Caunter for the supply of the necessary material, at £35. The actual work is to be entrusted to the Board's engineer.

Barnsley.—The Electricity and Lighting Committee has accepted the following tenders for coal:—Mr. R. E. Williams, 3,250 tons; Messrs. J. Wilby, Ltd., 3,250 tons.

Carlisle.—The T.C. has decided to renew for a period of 10 years, at £55 per annum, the agreement with the Tudor Accumulator Co., Ltd., for the maintenance of the lighting battery at the electricity works.

Chesterfield. - The T.C. has accepted the following tenders for plant for the electricity works :-

British Westinghouse Co., Ltd. - 100-xv. alternator, &c., £877.
Babcock & Wilcox, Ltd. - Boiler, £997; superheater, £195; mechanical stoker, £280.
Clay Gross Iron Co., Ltd. - Economiser, £359.

Croydon.—The Lighting and Electricity Committee scommends that contracts be entered into with the following firms :-

MB: — J. H. Gilman & Co.—8,000 tons Kingsbury Ryder beans, 24s. 10d. per ton: 2,500 tons Mapperley small nuts, 25s. 6d. per ton: 3,600 tons Portland and Linby slack, 23s. 6d. per ton.
Cleeves & Co.—3,000 tons of shipley peas, Manners peas, Mapperley small nuts and Manners small nuts, 25s. 6d. per ton.

Darlington. - The T.C. has accepted the following

tenders for the electricity works:—
Cochrane & Co., Ltd.—Condensing water pipework.
British Thomson-Houston Co., Ltd.—H.T. switchgear,
Musgrave & Co.—Induced-draught fan.

Gosport. — The contract for the installation of the electric light at the new Girls' Hostel, Milton, has been secured by Messrs. W. N. Walters, of Gosport.

Gravesend.—As the Western Electric Co. is unable to supply cables under the schedule contract prices, the T.C. has decided to obtain quotations from that company and from Messrs. Henley's, Ltd., and to accept the lowest.

Heckmondwike.—The U.D.C. has sealed a contract with Mr. F. E. Moss for 2,000 tons of coal for the electricity works.

London.—Bermondsey.—The Electricity Committee recommends the purchase of 2,000 tons of Mansfield nutty slack from Messrs. Usher & Co., at 19s. 9d. per ton, and 1,200 to 2,000 tons of Shipley nuts from Messrs. Myers, Rose & Co., at 22s. 6d. per ton.

HAMMERSMITH.—The Electricity Committee reports that up to the present the Council has authorised the Committee to purchase and store up to a maximum of 6,000 tons of coal; orders to the amount of 3,850 tons have been placed. The Committee is of opinion that full advantage should be taken of the coal-storage facilities now in working order at the generation that the second state of the coal-storage facilities now in working order at the generation that the second state of the coal-storage facilities now in working order at the generation that the second state of the coal-storage facilities now in working order at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities and the generation of the coal-storage facilities now in working orders at the generation of the coal-storage facilities and the generation of the coal-storage facilities and the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the generation of the gen of opinion that full advantage should be taken of the coal-storage facilities now in working order at the generating station by maintaining a more adequate reserve than the present authority permits, in order to avoid possible contingencies, and recommends the Council to accept the following offers:

Cory Bros. & Co., Ltd.—2,000 tons of Gedling ½-in. High Hazel slack, at 17s. 9d. per ton.

Harrison.—8,000 tons of the coals submitted, at 18s. 7d. per ton.

G.P.O.—The tender of the Edison & Swan Co, for a six months' supply of "Royal Ediswan" (tungsten) drawn-wire lamps has been accepted.

The tender of the Alpha Manufacturing Co, has been scoepted by the Metropolitan Asylums Board, at £32, for installing electric radiators at the head office, Embankment, E.C.

Lowestoft. — The E.L. Committee recommends the acceptance of the tender of Messrs. Bradbury, Son & Co., Ltd., for the supply of 500 tons of coal, at 19s. 2d. per ton; also that of Messrs. Kaye, Son & Harper for 2,000 tons, at 19s. per ton.

Manchester.—The Corporation has placed an order with Messrs. Ed. Bennis & Co., Ltd., for four complete chain-grate stokers, each 8 ft. by 14 ft., for the new B. & W. boilers recently installed in the electricity station.

Meter Contracts.—The Stoke-on-Trent Council has placed a portion of its contract for D.C. meters for 12 months with the Electrical Apparatus Co., Ltd. Messrs. Chamberlain and Hookham, Ltd., have also received a contract from Stoke-on-Trent for meters for the coming year.

Salford.—The T.C. has accepted the offer of the British Westinghouse Co. for a 5,000-KW. turbo-alternator at the electricity station, Frederick Road, for £16,200. At a special meeting held on Wednesday it was stated that last October the Council authorised the acceptance of an offer of a 5,000-kw. turbo-alternator from a Rugby firm, but the latter had since intimated their inability to complete the contract in time for next winter's load. It was necessary that plant should be obtained, and that was why the present proposal was made.

Southend-on-Sea.—In reference to the tender recently southend-on-sea.—In reference to the tender recently accepted by the Council for an overhead travelling crane required for the new sub-station, the contractors having stated that they are unable now to supply these cranes at the amount of their tender, the Committee has decided that only the one crane required at the Leigh sub-station be purchased at the present time. The tender of Messrs. F. Carrick & Sons, at £167, is to be accepted. The Corporation is recommended by the Light Railways Committee to accept the tender of Messrs. Edward Le Bas for a half-mile of overhead trolley wire, at 111d. per pound.

Swansea.—The tender of the British Westinghouse Electric and Manufacturing Co., Ltd., has been accepted by the Electricity Supply Committee for a 250-kw. rotary converter, transformer and switchgear, at £970.

The offer of Messrs. J. R. Davies & Co. to supply coal to the electricity station at 20s. 6d. per ton, for a period of nine months, has been accepted.

has been accepted.

Wolverhampton.—The T.C. has accepted the following

Underfeed Stoker Co., Ltd.—Automatic stokers for No. 9 boiler at the electricity works, at £600.

Holly Bank Coal Co., Ltd.; W. H. Bowater, Ltd.; and W. Harrison, Ltd.—Fuel for the electricity works.

Brentnall & Cleland.—Coke-dust fuel for the electricity works.

#### FORTHCOMING EVENTS.

Incorporated Municipal Electrical Association.—Friday, June 18th. At Institution of Electrical Engineers, Victoria Embankment, W.C. At 9.30 a.m., Council Meeting; 10 a.m., Annual General Meeting.

North of England Institute of Mining and Mechanical Englacers.—Saturday, June 19th. At 2 p.m. At Wood Memorial Hall, Newcastle-on-Tyne. General Meeting.

Physical Society.—Friday, June 25th. At 5 p.m. At Imperial College of Science, South Kensington, S.W. Papers on "A Theory of the Electrical Resistance of Metals," by Sir J. J. Thomson, and on "An Unbroken A.c. for Cable Telegraphy," by Lieut. Col. Squier.

#### REVIEWS.

Electric Mine Signalling Installations. By G. W. L. PATERSON. London: Constable & Co. Price 4s. 6d. net.

The author's aim is to provide a book useful to practical men engaged in mine signalling work. Bearing this in mind, we believe he has devoted too much space to very elementary matter and not enough to types of apparatus, their installation and maintenance. Nothing is said con-cerning the avoidance and treatment of "troubles," but these topics are of prime importance to the practical worker. The first half of the book might profitably be condensed, leaving more space available for the treatment of complete signalling circuits and equipment. In Chapter II, the internal construction of the enclosed ringing keys and tappers should be illustrated in the interests of students or beginners, to whom this and the following chapters will chiefly appeal. The action of bells, signal alarms and relays is described very fully in Chapter III, which is admirably illustrated. The average colliery electrician can hardly need such detailed treatment of this elementary topic, and would surely prefer to see more space given to the special methods, problems, and apparatus of mine signalling. Some of the indicators mentioned in the earlier pages of Chapter IV cannot be considered suitable for present-day use, and the description of some of the more modern types should be amplified. Chapter V dealing with electric generators, transformers, rectifiers, and accumulators for mine signalling circuits is very satisfactory, but the next chapter, on primary cells, occupies 29 pages and should be shortened considerably, particularly since the use of these cells is becoming less common in up-to-date installations. In Chapter VII the author describes and illustrates clearly the different arrangements of signalling circuits available, but does not sufficiently emphasise the fact that visual shaft signalling is now compulsory in this country. The rule on this point is given in the appendix, but its effect in restricting the choice of apparatus is overlooked. Several very reliable signalling systems complying with the latest rules are not mentioned. The chapter on engine plane signalling is very useful, as, too, are those on shaft and engine plane signal wiring. The collection of English and American Rules in the appendix, and of symbols for mining map circuits, &c., deserves mention. The production and indexing of the book are excellent, and by curtailing the elementary sections and amplifying those of more "special" nature, the author could easily convert this into a manual indispensable to the colliery electrician. At present the book is rather dear.

Model Answers to Test Questions in Wireless Telegraphy.
Series 1 and 2. London: The Wireless Press. Price
1s. each set (net).

Series 1.—This little book of answers is a thorough and painstaking attempt to get the very best out of the series of test cards that we reviewed in our issue of January 8th.

The answers are very full, and although a little conversational in places, there can certainly be no better answer to the question: "What happens when a piece of rubbed sealing wax is brought near some small pieces of paper?" than "Try for yourself; you may find out something which is not mentioned in any text-book."

The Model Answers to Series 1 naturally suffer on account of the defect noted in the cards, viz., a lack of sequence. This inevitably leads to repetition in the answers, and results in such anomalies as the reference to  $\tau$  and L aerials on page 40, and their description and illustration on page 72. There are also a number of minor errors.  $\pi$  is used instead of  $\lambda$ , and there is a muddle in the variations of the  $v = n \lambda$  formula on page 31; "97" should read "96" on page 32, and in the answer to question 102, "frequency proportional to  $1/\sqrt{\text{length}}$ " should be "frequency proportional to  $1/\sqrt{\text{length}}$ ." The diagrams are in some cases microscopic. The best answers are those on Changes of Energy, on page 59; Magnetic Detectors, on page 71; and Aerials, on pages 71 to 75.

Series 2.—The answers to this series are insufficiently illustrated; the only section to which this does not apply is that on Aerials. There is too much reference to Hawkhead's Manual for diagrams, and there are futile attempts to describe such apparatus as Wimshurst machines, electroscopes, and cells without the aid of any diagrams at all. The sections on Resistance, &c., and the more technical answers to Cards 22 to 47 are, however, much more satisfactory.

The student who writes conscientious answers to the test questions and then refers to these Model Answers, cannot fail to gain a sound knowledge of wireless telegraphy. At the same time, he will learn how to express himself clearly and scientifically—a by no means small achievement.—P. H. S. K.

#### NOTES.

Water-Power Utilisation in Sweden.—The annual Year Book of the Swedish Chamber of Commerce in London, just issued, contains an article on the subject of the utilisation of water-power in Sweden. It is based partially on an article by Mr. W. Borgquist, which recently appeared in the Teknisk Tidskrift, and partly on a pamphlet issued by the Swedish Water-Power Association.

According to the Swedish Board of Trade statistics, water-power was estimated in 1912 at 60-65 per cent. of the total effective power, but as water-power is used, on an average, for a longer period than steam power, the actual value may be put at 80 per cent. The figures show its importance in the question of power economy in Sweden, and the extent to which the country has made

oent. The figures show its importance in the question of power economy in Sweden, and the extent to which the country has made itself independent of imported fuel.

It is only during the last 10 or 15 years that water-power has been brought largely into use, i.e., since the technique of power transmission became more generally known. The newly-established electrochemical and electrothermal industries are practically dependent upon an ample supply of electrical energy generated by water-power. Among the most important power stations in Sweden, from south to north, are the following:—

H.P.

1		H.P.
South Swedish Water Power Co	•••	27,000
Hemejo Water Power Co	•••	10,280
Yngeredsfors Water Power Co		16,250
Trollhattan (State-owned, to be extended		,
110,000-120,000 H.P.)		80,000
Gullspang-Munkfors Water Power Co	•••	16,950
Guldsmedshytte Co	•••	6 750
Virsbo-Ramnas Water Power Co	•••	3.045
Untra Water Power Works (still under const		.,
tion, belonging to the City of Stockholm)	•••	42,000
Alfkarleby Water Power Works (State-owned	: to	,
be completed during the present year)	•••	45.000
Horndals Ironworks Co		8,000
West Dal River Water Power Co		19,200
Graningeverkens Co	•••	9,150
Klabbole	•••	4,525
Finnforsen	•••	9,400
Sikfors	•••	5,000
Porjus (State-owned)	•••	50,000
•		

As regards water-power plants erected exclusively for industrial purposes, the following may be mentioned as being amongst the largest:—Uddeholms Co., in Vermalnd Province, about 35,000 H.P.; Stora Kopperbergs Bergslags Co., on the Darlecarlia River, about 50,000 H.P.; Stockholms Superfosfat Co., on the Ljungan River, at Wansbo, about 30,000 H.P.; Alby Waterfalls Co., on the Ringdalsforsen River, and at Alby, about 15,000 H.P.

Among the new plants recently completed and at present in course of erection, it may be mentioned that the first turbine at the Porjus station was started in October last, and during the following month the first ove train was driven through the Lapland

Among the new plants recently completed and at present in course of erection, it may be mentioned that the first turbine at the Porjus station was started in October last, and during the following month the first ore train was driven through the Lapland fields by electrical energy supplied from the Porjus station. The State-owned Alfkarleby Water Power Works, in the North of Sweden, is rapidly approaching completion, two of the large turbines being ready at the end of the past year. As regards the well-known Trollhattan plant—the largest in the country—the Government last year decided to increase this to the extent of a further 30,000-40,000 H.P.; when the new work now in hand is finished, the water-power utilisation plant in Sweden will represent an aggregate of 915,000 H.P., or approximately 15 per cent. of the total resources of the country. About 2,500,000 H.P. can be obtained from falls in Northern Sweden, which is, however, but sparsely populated. The falls in that part of the country are, therefore, proportionately more expensive to harness than those in Central and South Sweden.

So far as the new plants actually completed in 1914 are concerned,

So far as the new plants actually completed in 1914 are concerned, these represent a total of approximately 40,000 H.P., divided as follows:—Iron and mining industries, 15,000 H.P.; timber, wood pulp, and paper trades, 15,000 H.P.; textile industry, 1,000 H.P.; various other industries, 9,000 H.P.

Municipalisation of Electricity Works in Russia. The Notois Vremya, commenting on the repeated discussions in the Petrograd Town Council respecting the proposed purchase by the town of the electric enterprises, observes that two sittings have already been devoted to this question, and that it still remains in already been devoted to this question, and that it still remains in obscurity. A special Committee has considered it, and the opinions of its members are divided. The conclusions of the experts are also divided. Prof. A. V. Wolf believes it advantageous to buy up all three concerns; Engineer M. N. Lovitsky thinks it undesirable to buy out the Belgian company and the former Helios company, because their construction and equipment do not correspond to the level of efficiency reached by the industry at the present time. The best technical installation is that of the 1886 company, and if that is bought out—is it Swiss? Notwithstanding the divergent views of informed and competent authorities, one group is decided on the purchase of all three concerns, and apparently no words of the independent members will move them from their decision, or to make fresh inquiries. Prof. Zagorsky, whom they support, insists on the purchase of all three. According to him, the competition of the town with poorly equipped electrical companies will be unprofitable—not for the companies, ectrical companies will be unprofitable—not for the companies, but for the town.

but for the town.

The paper quoted says that the inhabitants require cheaper electrical energy, and advantage must be taken of the opportunity, though it would be unprofitable to buy out all three companies. The town should rather extend its own electric station, but this, in the opinion of the present majority of the town Duma, is equivalent to the renunciation of cheap electric power in the coming years. There remains only one issue—to buy the best equipped concern, the 1886 company. The question of the acquisition of this concern may be simplified in the near future. If the mask of Swiss proprietorship be torn from the company and the real enemy, Germany, made to appear, the business of the company can be liquidated and the concern be passed into the possession of the town without compensation.

A note from Moscow says that the management of the 1886 Electric Co. has announced to the Moscow Town Council that the

Electric Co. has announced to the Moscow Town Council that the Electric Co. has announced to the Moscow Town Council that the Moscow electric station is working exclusively with petroleum fuel, and requires from 13,000 to 18,000 poods of petroleum residue per day. Such fuel had been bought for 1915, and for a considerable part of 1916, but owing to the existing exceptional position of affairs, when both coal and petroleum are scarce, and even wagons for carrying them, the company fears that it will not receive the necessary quantity of liquid fuel to carry on its business. On the other hand, if the station were to cease the use of oil fuel, at all events, there would be a possibility of more for the ness. On the other name, it the station were to cease the use of oil fuel, at all events, there would be a possibility of more for the other industries in the Moscow district that require such fuel. The memorandum points ont that even before the war the Electricity Transfer Co., in which the 1886 company is interested, began to work the peat deposits of the Bogorod district in the Moscow Government, and built there a central electric station which amongst other chiefs was intended to supply revented. which, amongst other objects, was intended to supply power for Moscow produced from peat. Up to the present time the company has spent 11,000,000 roubles on its plant, and is exploiting

pany has spent 11,000,000 roubles on its plant, and is exploiting the peat reserves on a large scale.

The supply of Moscow with electric power, generated by means of peat fuel, is both of local and Imperial interest, and the effect of it should be to reduce the price of fuel in the Moscow district. This delivery of energy into Moscow from peat should be of particular importance at present in relieving the pressure on the railways, and the appearance of cheap energy in the district in such a convenient form as electric power delivered by conductors without any call on the railways, must correspondingly further the interests of the Moscow industries and residents.

Hitherto the Moscow Government has contested the right of the

Hitherto the Moscow Government has contested the right of the company to use current generated from the Bogorod peat for Moscow, because the agreement between the town and the 1886 company does not provide for the purchase of energy from outside. And although the company takes its stand on another point of view—that what the contract does not prohibit may be permitted—it is observed that until the Moscow market had permitted—it is observed that until the Moscow market had experienced an extreme scarcity of fuel or great difficulties in its conveyance, the company abstained from using electricity generated from the Bogorod peat, but carried out experiments with the object of learning the technical possibility of transmitting current over a distance of 75 versts to the Moscow cable system. The crisis that has arisen in coal, petroleum, and wagons, constrains the management of the company to raise afresh the question of the use of energy generated from the peat of the Moscow district.

The request referred to has met with resolute opposition in the Moscow Town Council. The chief of the town, M. N. Chelnokoff, making use of the company's declaration of its difficulties, agitated once more for the transfer of the station to the control of the town, which he believes is capable of ensuring its uninterrupted working.

working.

Water-Power in New Zealand.—The New Zealand Official Year Book for 1914 contains the following particulars of Official lear Book for 1914 contains the following particulars of the water-power available throughout the Dominion. The Public Works Act of 1908 vests the sole right to use the water-power of the Dominion in the Crown, subject to existing rights. The right in the case of local authorities is issued free of royalty, and in The Public the case of private individuals, subject to a royalty of 20d, per unit generated.

A large and comprehensive scheme is now under consideration for the supply of electrical energy in the North Island, with the object of making it generally available, as far as possible, to all the towns and districts throughout the Island, and it is anticipated that advantage will be taken of the facilities offered to work the railways by electricity, and to promote a system of light railways

throughout the country districts now suffering from lack of communication because of the difficulty of obtaining stone for surfacing the roads. In all there are 24 different sources of power in the North Island and 48 in the South Island.

The following table shows the actual horse-power in use in the

various districts in 1913:-

						1913.

Co., 20 H.P.; Reefton, E.S. Co., 20 H.P.; Reefton, E.S. Co., 20 H.P.; Reefton, E.S. Co., 20 H.P.; Reefton, E.S. Co., 2 80 H.P.

The above data include no reference to the Lake Coleridge hydroelectric plant, the first section of which has now been successfully brought into use; ultimately 13,000 H.P. will be developed.—New Zealand Shipping and Commerce.

Stowmarket Explosion. — The report of Major A.

Stowmarket Explosion. — The report of Major A. Cooper-Key, H.M. Chief Inspector of Explosives, on the fatal explosion at a Stowmarket factory on May 10th, gives further particulars with regard to the circumstances. It states:—

"On the morning of the accident cordite M.D. was in course of manufacture. It appears that at the moment of the accident two men in the building were on the point of handing out to two bogic runners the bags of cordite paste for removal to the handmixing house. Before being placed on the bogic the bags are wiped down to get rid of the gun-cotton dust, and also to remove to some extent the water from the bottom of the bags due to their having been standing on a wet floor. In order to avoid the use having been standing on a wet floor. In order to avoid the use of a loose implement of any kind this operation was done by hand, and not with a brush. It was a fine, dry, cold morning, and the and not with a brush. It was a fine, dry, cold morning, and the two men in the building were wearing stout rubber overshoes, which would completely insulate them from electric contact with 'earth.' The bags were of rubber-impregnated canvas a market which would completely insulate them from electric contact with 'earth.' The bags were of rubber-impregnated canvas, a marked dielectric, and in the case at any rate of a man with a naturally dry ekin the operation of wiping the bags would undoubtedly have the effect of generating in his person a statical charge of electricity which might well be sufficient to cause a spark to pass as soon as he should happen to 'earth' himself by touching an uniqueled article. insulated article.

insulated article.

"This may perhaps appear at first sight to be a somewhat farfetched explanation of the accident, but I am convinced it is the
true one. Mr. Duff Grant, the managing director of the New
Explosives Co., told me that when on a visit to Canada, where,
with the temperature below zero, the air is frequently practically
free from moisture, he proved by personal trial that by rubbing
the feet on a thick pile carpet the gas could be lit by a spark from
the end of the finger, and this not occasionally, but every time.
When I mentioned this to the Messrs. Dupré they said that their
brother, who has been in Canada for some time, told them that on
cold, dry days it was a favourite joke at five o'clock tea parties to
shuffle the feet on the carpet before handing a plate of sandwiches,
with the result that the person helping himself would receive
quite a considerable electric shock."

A case is also mentioned relating to a factory at Ardeer, where

A case is also mentioned relating to a factory at Ardeer, where workman wearing rubber shoes fired acctone vapour by a spark from his finger after merely allowing the thin strands of rifle

oordite to pass over his hand.

It seems, therefore, that the Inspector's theory is well within the bounds of probability, though at first sight it might appear inadequate. The best safeguard apparently against such accidents would be the thorough ventilation of all buildings to prevent the accumulation of explosive mixtures of gas and air.

Magnetic Elements.—The report of the Astronomer-Royal shows that the mean values of the magnetic elements at Greenwich for 1914 were as follows:—Declination W. 15° 6'3'; horizontal force, 0'18518 C.G.s. units; dip 66° 51' 13".

Patents and Alien Enemies.—The Board of Trade has granted licences to G. H. Wilson, of the Manchester Armature Repair Co., in respect of patents Nos. 10,457/06, 2,711/10, 20,634/10, 9,941/11 and 27,651/12.

Coal Supplies.—A deputation representing the gas and electrical interests attended at the House of Commons on Wednesday, June 9th, and laid before a meeting consisting of about 200 Members of Parliament the serious difficulties which they were experiencing owing to the shortage of coal. Lord Claud Hamilton presided, and the speakers were Sir Corbet Woodall, Sir John Snell, Alderman Kay, Mr. F. Bailey, Dr. Charles Carpenter, Bailie Irwin, and Bailie W. B. Smith.

Attention was drawn by the various speakers to the seriousness

Attention was drawn by the various speakers to the seriousness of the shortage, which was due to several causes, among which was mentioned particularly the enlistment in the Army and Navy of a large number of miners. In addition, it was pointed out that a large proportion of coal was sent abroad, but a Committee had been appointed by the Government for dealing with the export of coal, and the effect of the work it had done was already apparent. The question of the all-round necessity and utility of gas and electricity was urged at length. It was also pointed out that a number of gas and electricity undertakings had so adapted their plant that they were producing materials of vital importance to the Government, and, furthermore, that the residuals were necessary to a great variety of important industries. One large London gas company could increase their supply of these by-products by sary to a great variety or important industries. One large London gas company could increase their supply of these by-products by some 40 per cent. by using coal instead of oil for their gas production, and it was suggested that if the Government realised the importance of this aspect of the question they would help gas

undertakings in every way to obtain supplies of coal.

Generally speaking, it was an absolute impossibility to take in sufficient coal during the winter for the winter's requirements, and therefore a large stock had to be accumulated during the summer months when the demand was not so heavy. This year it had, so far, been impossible to carry out this system, and if the stocks were not made up by the middle of October the public undertakings would be unable to continue their supply through the coming

Various means of improving matters were suggested, amongst which were mentioned a limitation of further recruiting of miners, a suspension of the operation of the Eight Hours Day Act in respect of collieries in order to increase the actual output of coal, the fixing of a maximum rate of freight for all interned vessels, further facilities generally for the transport of coal, and a continued limitation of the export of coal. Finally, it was urged that if Members representing mining districts could induce their constituents to work full time, a large part of the difficulty of

shortage would be overcome.

The meeting was adjourned till Tuesday last, when a committee was formed to consider the subject, and to formulate recommendations which should be laid before a later meeting. The Committee consists of 12 members, representing the coal-owners, the workmen, the great consumers, and the ship-owners:—

Colliery proprietors.-Sir Arthur B. Markham, Sir Alexander

Henderson, and the Hon. H. D. McLaren, hip-owners.—Sir Walter Runciman, Mr. R. D. Holt, and Mr. Ship-owners.—Sin R. P. Houston.

Workmen.—The Right Hon. Charles Fenwick, Mr. T. Richards, and Mr. B. Kenyon.

Consumers of coal.—Mr. W. Joynson-Hicks, Sir Daniel Ford

Goddard, and Sir Corbet Woodall.

It is hoped that this Committee will be able to submit recommendations to the adjourned conference next Tuesday.

Automatic-Lift Accidents.—A correspondent using the seudonym "Leeds" writes (too late for inclusion in our Correspondence "columns):—"Having read with much interest pseudonym "Leeds" the correspondence of the last few weeks under the above heading, especially the letter of Messrs. Smith, Major & Stevens, which implies that the lift will not work with the gate open, that which implies that the firt will not work with the gase open, may is, no doubt, correct as far as starting the lift is concerned; but once it is started, should a fault develop on the controller (which is not an unknown occurrence), putting the switch-handle back to the off position in the cab, and opening a gate, will not stop the lift. It will continue in the same direction, bring out the 'tappet' switch, and finally come to the end of the lift run, and then blow the fuses. Now, it is possible for a person to jump out as the lift is passing one of the floors, perhaps with fatal results, and I contend that the gate locks do not cut off current in this instance. Is it not possible to wire up first to the gate locks and control the current to the motors?"

Anti-German Riots on the Rand.—Our Johannesburg correspondent, writing on this subject under date May 14th, 88 Y8 :-

It would be foolish not to admit that the great leniency shown to enemy subjects by the South African Government probably had a good deal to do with yesterday's outbreak. The spectacle of Germans growing fat on South African trade, particularly in electrical engineering and its kindred branches, while many South Africans are sacrificing their lives and neglecting their businesses in order to fight the Garmans is an examplating one. It forms in order to fight the Germans, is an exasperating one. It forms a perpetual source of irritation to the public mind. And it is easily comprehensible that this should be the case. The destruction of business premises may be one method of showing detestation of German methods. It is, however, open to the objection that it may inflict, and in one instance here (i.e., that of Siemens) has unfortunately inflicted, equally serious damage on Britishers, who may be actual owners of the premises. On the 11th inst. some little trouble occurred at the Brakpan power station of the V.F.P. Co. In connection with the construction work at present being carried out at this station, there were 16 men employed by Messrs. Reunert and Lonz, besides the fixed staff of the V.F.P. Co. On Saturday

last the A.E.G. Co. took on four German workmen. It was a significant fact that after the *Lusitania* tragedy became known, six of the German employés knocked off work at 9.30 p.m. instead of midnight, while the British workmen belonging to Mersra Reunert and Lenz, and another contractor, named A. Stewart, and the V.F.P. Co. completed their full shifts.

It is shrewdly suspected that the Germans left off work in order to celebrate the "most brilliant achievement" of their Navy.

The following evening the British workmen held a "council of war" and resolved that if the Germans still retained their jobs, they would refuse to go on shift. Eventually the whole of the German workmen were dismissed.

As previously mentioned, the Johannesburg branch of Messra. Siemens, Ltd., was burnt to the ground by the rioters, notwithstanding the fact that the firm is a British one. It is true that before the war the Johannesburg firm of Siemens, Ltd., were the agents for the German firms of Siemens-Schuckert and Siemens Halske, and this probably was the immediate cause of the trouble. The members of the staff of Siemens, Ltd., published in the Sar a protest against the damage done to the premises of a British

firm.

The store of the A.E.G. Co., situated in the "City and Suburban" township, was attacked later and formed a centre of interest for some considerable time. Entering the yard, men and youths started operations by smashing up the doors and windows in a very complete manner. The building, of wood and corrugated iron, was next invaded, and fires were started at several points.

The stock, with petrol. &c., was of a most inflammable description, and the building was soon in full glow. Prior to this lamps were taken from the store and flung against the wall, causing miniature explosions, which afforded much entertainment to the crowd. Here it was useless to think of saving the premises and

crowd. Here it was useless to think of saving the premises, and they were entirely gutted, although it took a considerable time completely to destroy the buildings.

Russia.—H.M. Consul at Batoum, in a report to appear shortly, says:—"The trade in electrical machinery had very largely, if not entirely, fallen into German hands, but the activity recently exhibited by United Kingdom manufacturers should succeed in gaining a part of the trade for British-made goods."

Electrical Incubator Tests .- The Aberdeen Daily Journal mentions that the Poultry Department of the North of Scotland College of Agriculture has recently carried out tests with an electrical incubator and hover (or foster mother), which was supplied by Mr. M. K. Cooper, of Mesers. T. C. Smith & Co., Aberdeen. This incubator—of 50-egg capacity—is fitted with a Accrosen. This inducator—or 50-egg capacity—is fitted with a patent thermostat for regulating the temperature and four 32-c.p. lamps; the hover is fitted with two 32-c.p. lamps. Both are of galvanised metal throughout and simple in construction. In one test 31 chickens were hatched out of 40 fertile eggs, and in another 36 out of 39 fertile eggs. These results are equivalent to 77 and 92 par cent. respectively of chickens hatched from fertile eggs, which represent a comparatively high percentage for artificially hatched chickens. The effectiveness of the hover can be judged from the fact that 65 chicks were reared out of 67; it provides an even distribution of heat, preventing overcrowding of the chickens. To hatch and rear each lot of chickens 41 units were required (at 1d. per unit, cost 3s. 5d.). The raising of numbers of early spring chickens can only be done successfully by artificial incubation.

Educational.—Sir Philip Magnus was recently entertained at dinner by the Association of Technical Institutions, and was presented with an address on the occasion of his retirement from the active direction of the Department of Technology of the City and Guilds of London Institute, after 35 years' service.

-The following question The Mobilisation of Science. was put to the President of the Board of Education and answered on Wednesday, after we had closed our leading columns, in which

we refer to this subject:—
Mr. Joseph Pease.—To ask the President of the Board of Education whether he proposes to carry out the scheme recently outlined for the development of research work and the better application of science to industry; and, if so, when will he be in a position to announce the names of the advisory council.

Mr. Arthur Henderson.—I certainly hope to carry out the scheme initiated by my right hon. friend, and I hope to be in a position to announce the names shortly.

Fatalities. - Newcastle. - Two men were killed by electric shock, late on Friday night, at the works of Meesrs. Armstrong, Whitworth & Co. A worker, named Thomas Harrison, dimmediately; another, named Edward Babbs, did not get the full force of the current, but he died while being removed to the infirmary. Three other men were seriously injured by electric shocks. The workmen were engaged in the electrical department of the works. The injured was formally opened on the 12th and adjourned until June 13rd. adjourned until June 23rd.

LONDON.—At an inquest held into the cause of death of a carman named Rocca, whose van skidded on an L.C.C. tramline while he was driving along Vauxhall Bridge Road, the police evidence showed that the tramrail was in an exceedingly bad condition, being worn away about an inch. The jury, in returning a verdict of "Accidental death," said that the L.C.O. was guilty of negligence in not keeping the line in proper condition,

ALDERSHOT.—An irquest was held by Mr. J. T. Coggins, Deputy Coroner, at Aldershot, on Saturday, on William Sutherland, 40, of Blyth, Northumberland, electrical wireman, employed by Messrs. Saunders & Co., York Street, London, electrical engineers, who died in the hospital on June 10th from injuries received in an accident at Pirbright Camp on June 7th.

The Coroner explained that deceased was carrying out certain work in connection with high-tension wires at the Camp. He was work in connection with high-tension wires at the Camp. He was fixing cradles underneath the wires, to reach which he had to use a ladder. The wires were naked, but before any workman commenced performing such duties as those of the deceased, the foreman of the job would telephone through to the power station at Aldershot Camp and get the current cut off. The man might then proceed with the work in safety. It was thought that in some way or other deceased must have touched the wire, for he seemed suddenly to spring or throw himself away from the ladder and fall to the ground.

Charles Williams, foreman of the works, said deceased was ing at a height of 26 ft., and the wire would be about 6 in. from the cradles underneath. Their instructions were not to proceed the cradles underneath.

with the work until the current was switched off.

with the work until the current was switched off.

Asked whether he took any steps to let the man know that he had not got through, witness replied that he came out of the call box and put up his hands to show that he could not get through. When he put his hands up it meant stop.

Charles Payne said deceased had definite instructions not to proceed with the work until the current was switched off, and William Fisher, supervising engineer, also gave evidence as to the instructions.

instructions.

Instructions.

Lieut. A. Ferguson, R.A.M.C., said the cause of death was fracture of the base of the skull. In reply to the Coroner, Witness said he should expect a man who had received an electric shock to be burnt, but he found no signs of such injuiry. Had deceased received a severe shock he would have been killed on the spot. The Coroner said the voltage was 3,000, but there was no real evidence that deceased touched the wire. It was possible that he might have received a slight shock which caused him to fall for the ladder. The jury returned a wardiet that deceased died as the the ladder. The jury returned a verdict that deceased died as the result of fracture of the base of the skull sustained by falling from

Notes. — Engineering Institutions' Volunteer VOLUNTEER TRAINING CORPS.—On the suggestion of General Sir O'Moore Creagh, V.C., G.C.B., G.C.S.I., an Engineer Volunteer Corps has been raised from members of the engineering profession who are either above military age, or who, being of military age, are prevented by some good reason from serving in the Regular

The objects of the Corps are:

1. To train men of military age and to make them useful Royal Engineer recruits if, and when, they are able to enlist.

2. To furnish Engineer units to assist in the completion of the

Volunteer organisation.

3. To organise the Corps so that the maximum advantage may be taken of the specialised engineering skill of its members at the

be taken or the specialised engineering skill or its members as the earliest possible moment.

Drill takes place through the kindness of Colonel le Rossignol and the officers of the London Electrical Engineers Corps at the Drill Hall, 46, Regency Street, Westminster. The training will be similar to that of the London Electrical Engineering Corps.

Although the first dvill only took place on the 2nd inst. already

similar to that of the London Electrical Engineering Corps.

Although the first drill only took place on the 2nd inst., already 130 members are enrolled. Membership is not restricted to members of the Engineering Institutions, and application should be made to the Commandant, Lieut.-Colonel C. B. Clay, V.D., at Marconi House, Strand, W.C.

3BD BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—Battalion orders, by Colonel S. G. Grant (Officer Commanding), Thursday, June 17th, 1915.

465. WEEK-END PABADES.

-"A" and "B" Companies will parade with North London Platoon at Enfield Railway Station (G.N.R.) at 2 30 p.m. sharp. Train from King's Cross Local (G.N.R.) at

2.30 p.m. sharp. Train from King's Cross Local (G.N.R.) at 1.41 p.m. Route march, and inter-company Shooting Competition at Enfield Rifle Club.
Order No. 456, in so far as it relates to "C" and "D" Companies, is cancelled. "C" and "D" Companies will parade at Baker Street Met. Station at 2.30 p.m., and proceed by train to wembley Park.

Sunday.—6 a.m. Reveille.

10 a.m. Church l Church Parade. Battalion Parade. 10.20 a.m.

2.15 p.m. Battalion Parade under Commandant.

467.—ENTRENCHING.—Men who have given in their names for above duty will parade each day at Liverpool Street Station (G.E.R., Low-Level Entrance), at 8.45 a.m.

For names of men detailed for each day see lists posted at head-quarters and at Wembley Park. Uniform will be worn. Arms will not be carried. Men will provide their own rations.

A. J. JOINER, Captain and Adjutant.

Appointments Vacant.—Shift engineer (£2 15s.), for Fulham electricity department; teacher of Electrical Calculations and Drawing for Wiremen's Classes (10s. 6d. per evening), for Middlesex Education Committee; switchboard attendant for Middlesbrough Corporation; assistant engineer and car-shed superintendent, for Sunderland District Electric Tramways, Ltd.; switchboard attendant for Torquay Electricity Department; works fitter (£2 10s.) for Rhondda U.D.C. Electricity and Destructor Particulars are given in our advertisement pages,

Late Legal.—RICKMAN v. F. W. BERK & Co., Ltd.-In the Lord Mayor's Court on Tuesday, before Assistant Judge Jackson and a jury, a claim was made by Thomas Rickman, yardman in the employ of the Electrical Power Storage Co., Ltd., against F. W. Berk & Co., Ltd., manufacturing chemists, of Fenchurch Avenue, E.C., for damages for personal injuries suffered owing to the alleged negligence of the defendants or their servants. Mr. Lever was counsel for the plaintiff, and Mr. Craig Henderson represented the defendants.

Counsel for the plaintiff said his client was employed by the Electrical Power Storage Co. at Millwall. His duties were to look after the yard. On February 11th the defendants sent a lead of 20 carboys of sulphuric soid. The carboys were extremely and carboys or sulphuric soid. The carboys were extremely dangerous to handle, and in order to protect persons handling them the mouths of the carboys were sealed with an earthenware stopper and were fixed into the neck of the carboy with plaster of paris. Upon the arrival of the vanload of carboys, the plaintiff and another Upon the arrival of the vanload of carboys, the plaintiff and another man went to assist in the unloading. The carboys weighed about 2 cwt. each. A sort of chute was used to unload the carboys from the tailboard of the van. When about half the carboys had been delivered, one was brought forward to the alightly aloping chute. This caused the acid in the carboy to splash up against the stopper, which, if it had been properly sealed in, would have prevented the liquid coming through. Some of the corrosive liquid in splashing against the stopper came through a hole between the stopper and the glass carboy, and splashed on to the plaintiff's face, nose, cheeks and chin. His burns were treated at Poplar Hospital, and from there he was sent to the London Hospital. The plaintiff was unable to continue his work for six weeks, and was during that time attending the Hospital as an out-patient. He had suffered a painful injury, and he now claimed compensation.

The Plaintiff, in his evidence, said that during the six weeks he

The Plaintiff, in his evidence, said that during the six weeks he was attending the hospital he had no wages. He had, however, received loans amounting to £3 10s., for which he gave I.O.U.'s. His standing wage before the accident was 28s. a week. On the day after the accident the wages of workpeople

were increased.

were increased.

Medical evidence having been given, it was stated for the defence that the liability of the defendants was completed when the carboy was put upon the tailboard of the van. As a matter of indulgence, the carman might give a little assistance by putting it on the top of the chute. When the carboys left the defendants factory they were acid-tight, and had there been any fissure between the stopper and the neck of the carboy the liquid must have splashed on to the carman while he was trundling the carboy along the van to the tailboard. It was while getting the next carboy that the carman heard a shout as though someone was in pain. Upon the carman turning there was a carboy on the ground, and a piece of plaster of paris which was on the neck of the carboy had broken away. Evidence was called by the defendants to show that in loading and unloading carboys they were handled vertically, and whether containing concentrated acid or dilute soid the stoppering was the same. There was a custom of using a leaden cup over the carboy in order to save any accident in case anything went wrong with the stoppers.

The jury returned a verdict for the plaintiff, awarding him

The jury returned a verdict for the plaintiff, awarding him £34 12s. damages, and judgment was entered accordingly, with

Trading with "Neutrals."-Since our leading pages went to press the Board of Trade has issued the following warning with regard to trading with the enemy :-

"The Board of Trade direct the particular attention of all manufacturers and traders concerned in the export trade to the need for scrupulous care in the transaction of their business abroad. The Government's reprisals policy, formally announced by the Order in Council of March 11th, 1915, is directed to suppress all enemy trade, whether import or export. The main difficulty in making this policy thoroughly effective arises from the fact that some traders in some neutral countries are making themselves. agents for the supply of goods to enemy countries. British firms engaged in foreign trade, therefore, must have regard to these circumstances, and survey with great caution every opening for business which is offered them by neutral importers or exporters.

Especial care should be taken in opening new accounts in respecial care should be taken in opening new accounts an neutral countries, and in relation to any orders or inquiries of an abnormal character. In any case of doubt as to the bona fides of particular consignees, business should be suspended pending reference to the Board of Trade. It is unadvisable that any new accounts should be opened by any British trader in neutral countries during the war without the fullest inquiries as to the character

of the business proposed to him.

"The Board feel sure that they can rely upon the cordial co-operation of all firms engaged in foreign business to secure the

co-operation of all firms engaged in foreign business to secure the successful working of the reprisals policy.

"It must be added that the proclamations relating to trading with the enemy cover indirect trading with the enemy through neutral agents, and that carelessness in transacting neutral business may involve traders in the severe penalties attaching to trading with the enemy."

It will be noticed that this warning relates mainly to the supply of goods to neutral firms; but the placing of large orders abroad, to which we drew attention, is of at least equal importance, for it may result in providing the enemy with funds.

MR. JOHN M. M. MUNRO, of Glasgow, has also opened a consulting office at 11, Randolph Place, Edinburgh.

Obituary.—The death has occurred of Mr. C. BONNETT, A.M.I.E.E., in hospital in Bombay, of smallpox, on May 8th. He has been in India over 13 years, most of the time in the employ-

has been in India over 13 years, most of the time in the employment of Messrs. Osler, and principally engaged on their Kabul work. He was a persona grata with the Amir, who keenly appreciated his good work there. Our Indian correspondent writes:—Outside his engineering work in Bombay Mr. Bonnett was known as a charitable worker among the poor and needy, who will seriously feel his sad loss. He was an honest man, of sterling qualities, who leaves a blameless record behind and a good axample for others to follow."

qualities, who leaves a blameless record behind and a good example for others to follow."

The death is announced of Mr. Frederick Lowe, who had for the past 27 years been with Mesers. Page & Miles, Ltd., electrical engineers, of Brighton. He was 52 years of age.

The death from pneumonia is announced of Mr. Charles Edward Hoars, of Rickmansworth, for many years electrician on the staff of the Metropolitan and Great Central Railway Co. He was in his forty-second year.

#### NEW COMPANIES REGISTERED.

Fuller's Wire and Cable Co., Ltd. (140,633).—This company was registered on June 11th, with a capital of £25,000 in £1 shares, to carry on the business of makers of telegraph, telephone and electric wires, cables and appliances, drawers, workers and weavers of wires, manufacturers of ropes, cords, twines, cables and hawsers, manufacturers and workers of indiarubber, rubber goods and fabrics, vulcanite, ebonite and similar commodities for medical, motor-car, sport, household and commercial purposes, mechanical and electrical engineers, etc. The subscribers (with one share each) are: G. Fuller, Elm Croft, Hulton, Essex, electrical engineer; G. J. A. Fuller, Badwell Cottage, Draycot Road, Wanstead, electrical engineer, Private company. The number of directors is not to be less than two or more than five; the first are G. Fuller, G. J. A. Fuller, L. Fuller, and F. J. Gordon. Remuneration £100 each per annum (chairman £150). Secretary (pro tem.): G. J. A. Fuller. Registered office: Wcodland Works, Wick Lane, Old Ford Road, Bow, E.

Buttevant Electric Co., Ltd. (4,252).—This company was registered in Dublin on June 11th, with a capital of £800 in £1 shares, to carry on at Buttevant and elsewhere the business of an electric light and power company. The subscribers are: C. G. Crofts, Velvetstown, Buttevant, Co. Cork, 240 shares; S. E. Crofts, Buttevant, Co. Cork, electrical engineer, 100 shares; S. Nolan, 2, Anglesea Terrace, Cork, electrical engineer, 230 shares; E. Nolan, Victoria Avenue, Old Blackrock Road, Cork, 230 shares private company. The number of directors is not to be less than three or more than five; the first are C. G. Crofts, S. E. Crofts, and S. Nolan, Qualification, £50. Registered office: Buttevant, Co. Cork.

H. Garstang, Ltd. (140,580).—This company was registered on June 7th, with a capital of £2,000 in £1 shares, to take over the business of an electrical and motor engineer carried on by H. Garstang at Mincing Lane and St. Peter Street, Blackburn. The subscribers (with 100 shares each) are: H. Garstang, Mincing Lane and St. Peter Street, Blackburn, electrical and motor engineer; Mrs. M. E. Garstang, Mincing Lane and St. Peter Street, Blackburn. Private company. The number of directors into to be less than two or more than five; the first are H. Garstang and Mrs. M. E. Garstang (both permanent). Qualification 100 shares. Remuneration as fixed by the company. Solicitor: C. W. Eastwood, 13, Richmond Terrace, Blackburn.

Barraclough Brothers, Ltd. (140,589).—This company was registered on June 8th, with a capital of £3,000 in £1 shares, to take over the business of electrical engineers recently carried on by Reside & Co., Ltd., at Perseverance Mills, Brighouse, Yorks., and elsewhere, to carry on the same and the business of mechanical and motor engineers, millerights, tool makers, ironmongers and general merchants, etc., and to adopt an agreement with W. H. Sayers. The subscribers (with one share each) are: W. Barraclough, Eastelfife, Lighteliffe, electrical engineer; F. Barraclough, Highfield Avenue, Bailiffe Bridge, electrical engineer, Private company. The first directors are W. Barraclough and F. Barraclough. Qualification, 190 shares. Solicitors: B. H. Richardson, 22, Briggate, Brighouse.

Free Wire Light Co., Ltd. (140,578).—This company was registered on June 7th, with a capital of £1,000 in £10 shares, to carry on the business of wiring houses of intending consumers of electric light with the necessary cables, wires, lamps, fittings and appliances, etc. The subscribers (with one share each) are: F. R. Reeves, Salisbury House, London Wall, E.C., accountant; J. N. A. Houblon, Artillery Mansions, S.W., engineer. Private company. The number of directors is not to be less than two or more than six; the first are F. R. Reeves, J. N. A. Houblon, and E. Reeves Solicitor: S. H. Brown, 2 & 5, West Street, Finsbury Circus, E.C. Registered office: Salisbury House, London Wall, E.C.

### OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Birkdale District Electric Supply Co., Ltd. (70,259).—Capital £50,000 in £5 shares. Return dated May 17th, 1915. 9,200 shares taken up; £5 per share called up on 6,000 and £3 per share on 3,200 shares; £39,600 paid. Mortgages and charges at date of return, £3,000; since issued (May 18th, 1915), £3,000 debs. ranking equally with first £3,000.

British Mica Co., Ltd. (72,187).—Capital, £5,000 in £1 shares (2,000 pref.). Return dated March 18th, 1915. 629 pref. and 2,000 cord shares taken up. £1 per share called up on 629 pref.; £629 paid; £2,900 considered as paid on 2,000 ord. shares. Mortgages and charges: Nil.

Altrincham Electric Supply, Ltd.—Particulars of £50,(NN) debentures, created by resolutions of June 7th, 1898, April 18th and October 3rd, 1912, and May 31st, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £3.200. Property charged: The company's undertaking and property, present and luture.

Atlas Carbon and Battery, Co., Ltd. (34.857).—Capital, £2,000 in £1 shares. Return dated December 29th, 1914 (filed March 26th, 1915). All shares taken up; £8 paid; £1,992 considered as paid. Mortgages and charges: £3,000.

Bastian Meter Co., Ltd. (53,304).—Capital £20,235 10s., in 3,000 pref. shares of £1 each and 68,942 ord, shares of 5s, each. Return dated March 11th, 1915. 2,011 pref. and 39,672 ord, shares taken up; 5s, per share called up on 4,272 ord, and £1 per share on 2,011 pref.; £3,082 10s paid, including £3 10s, paid on 14 shares forfeited; £8,850 considered as paid on 35,400 ord, shares. Mortgages and charges; £1,450.

Beck and Moss, Ltd. (69,298).—Capital, £2,500 in £1 shares. Return dated March 13th, 1915. All shares taken up; £1 per share called up on 525; £525 paid; £1,375 considered as paid on the remainder. Mortgages and charges: £3250.

Navaltum, Ltd.—Particulars of £5,600 debentures, created March 22nd, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £5,000. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees. A memorandum of satisfaction in full on May 22nd, 1915, of debentures dated May 8th and July 3rd, 1914, securing £900, has also been notified.

Carville Site and Power Co., Ltd.—Issue on May 28th, 15. of £10,000 debentures, part of a series of which particulars have already

#### CITY NOTES.

#### Globe Telegraph and Trust Co., Ltd.

The net revenue for the year ended May, 1915, after deduction of expenses, amounts to £209,165, and makes, with £25,724, brought forward, a total of £234,888. From this there has been distributed £129,122, in interim dividends, leaving \$\frac{\pmathbb{125}}{6}\$. The directors now recommend final dividends of 3s. on the preference and 6s. on the ordinary, bringing up the total distributions in both cases to 6 per cent. per annum. There then remains \pmathbb{27},655 to be carried forward.

Digitized by Google

During the year £11,200 Anglo-American Telegraph Company's preferred stock has been sold, and the proceeds have been re-invested in shares of the Great Northern Telegraph Co. and Direct Spanish Telegraph Co. Seventeen certificates of the Submarine Cables Trust, belonging to this company, have been drawn and paid off at £120 per certificate, producing £2,040; most of this has already been re-invested, and the remainder will be placed in suitable securities.

### German-Netherlands Telegraph ('o.

The report for 1914 of the Deutsch-Niederlandische Telegraphen Gesellschaft, of Cologne, states that the cable station at Yap was placed under the Imperial District Board on August 1st, and the working of the Menado station was taken over by the Netherlands Indian Government two days later, over by the Netherlands Indian Government two days later, the company's Dutch officials continuing the cable service. On October 7th the island of Yap was occupied by the Japanese, and from that time the company's cable service had to be entirely suspended. The cables, as shown by recent tests, are in good condition. The officials were first conveyed to Nagasaki by the Japanese, but were released after a few days; the German officials are now at Shanghai, whilst the oldest Dutch telegraphist was permitted by the Japanese to remain with a German superior official at Yap to look after the company's property. The accounts show gross receipts amounting to £102,900, as compared with £103,200 in 1913, interest and balance forward increasing the sums to £108,100 amounting to £102,900, as compared with £103,200 in 1913, interest and balance forward increasing the sums to £108,100 and £108,500 in the two years respectively. After meeting general expenses, the amount of £8,750 has been placed to the cable renewal fund, as in 1913, and £14,000 to the cable maintenance and repairing funds, as against £14,800, leaving net profits of £41,600, as compared with £40,300 in the previous year. A dividend at the rate of 64 per cent, has been declared on the ordinary share capital of £35,000, being the same as in 1913, and £11,300 has been carried forward. The report adds that the agreement with the Great Northern Telegraph Co. that the agreement with the Great Northern Telegraph Co., of Copenhagen, for the repair of the company's cables in cases of interruption has been prolonged for a further period of 10 years, as from June 1st, 1915, although the annual payment for the service has been reduced by £3,000.

### A Swiss Investment Undertaking.

The Motor, A.G. fur Angewandte Electricitat, of Baden, Switzerland, which is chiefly a holding company belonging to the Brown-Boveri group, reports that the influence of the war on the electrical distribution of power varied according to the geographical situation of the undertakings. On the outbreak geographical situation of the undertakings. On the outbreak of hostilities a large reduction in the consumption of power suddenly took place in general, although a renewed demand soon arose, even in the case of works whose area of supply lies within the war area. The most important event of the year was the disposal of the shares held in the Beznau-Lontsch power works to the North-East Swiss power works, in which nine Swiss cantons are interested. Thus there had passed from the company's possession highly remunerative shares in an undertaking which the company had brought to a great level of development in the course of many years, but the directors had been unwilling to adopt a negative attitude towards the proposals put forward by the cantons. On the other hand, the company acquired 40 per cent. of the shares in the Gustav lignite mines at Dettingen-on-the-Main, in order to provide fuel in connection with a comprehensive extension to provide fuel in connection with a comprehensive extension of the works of the Electric Power Supply Co., of Mannheim, of the works of the Electric Power Supply Co., of Mannheim, which is financially interested in the local Brown-Boveri Co. After meeting the interest charges on the loan capital of £1,827,000, and apportioning £5,200 to depreciation as against £3,400 in 1913, the accounts of the Motor Co. indicate net profits and balance forward totalling £125,000, as contrasted with £115,000 in the previous year. It has been decided to pay a dividend of 7 per cent. on the ordinary share capital of £1,500,000, being the same rate as in each of the two preceding years, leaving £2,800 to be carried forward, as against £1,500 in 1913. £1,500 in 1913.

#### Italian Electrical Companies.

The Societa Italiana per la Fabbricazione dell' Alluminio, of

The Societa Italiana per la Fabbricazione dell' Alluminio, of Rome, in which a group at Rome is interested as well as German capital, reports gross profits of £17,500 in 1914. The sum of £12,000 has been applied to depreciation, and £4,000 placed to the reserve fund, the balance being carried forward. As a consequence no dividend is payable on the share capital, which was reduced in 1911 from £120,000 to £48,000. The Elettricita Alta Italia, of Turin, with which the Swiss Electrical Industry Co. is associated, reports that the transission line between Montjovet and Bollenzo was brought into operation in 1914, thus enabling the company to derive full advantage from the hydro-electric works in the Aosta Valley. The net profits, after allocating £38,000 to depreciation, as compared with £36,000 in 1913, amount to £62,000, as against £62,200, thus enabling the payment of a dividend of 5½ per cent. on the ordinary capital of £1,000,000 as in the previous year.

vious year.

The Officini Elettriche Genovesi, which is connected with the Zurich Bank for Electrical Undertakings, and affords a

supply in Genoa and neighbouring districts, reports gross profits of £159,000 for 1914. After defraying interest on loan capital amounting to £794,000, and setting aside £40,000 for depreciation, the net profits and balance forward are returned at £89,600, as against £89,200 in 1913. It is intended to distribute 10 per cent. on the ordinary share capital of £800,000, being the same rate as in the preceding year.

The report of the Unione Italiana Tramways Elettrici, of

Genoa, which is closely associated with the Zurich Bank for Flectrical Undertakings, states that the conditions of the new contract with the municipal council came into full operation in 1914 for the first time. After devoting £32,800 to depreciation, as compared with £30,000 in 1913, the accounts show net profits of £70,400, as against £76,000 in the previous year. It is proposed to pay a dividend of  $8\frac{1}{2}$  per cent. on the share capital of £720,000, as contrasted with  $9\frac{1}{2}$  per cent. in 1913, to place £3,300 to the reserve fund, and to carry forward the balance.

#### German Electrical Companies.

The Concordia, Elektrizitats Gesellschaft, of Dusseldorf, carned gross profits of £24,500 in 1914, as contrasted with 224,000 in the preceding year, and net profits of £12,300, as against £10,000. It is intended to pay a dividend of 10 per cent., as compared with 20 per cent. in 1913, to place £4,000

to a war reserve fund, and to carry forward £2,800.

The Treuhand Bank fur die Elektrische Industrie, of Berlin, which now belongs to the A.E.G.—Carlswerk group, participated, in 1914 for the first time, as a financing institution, for which purpose it was originally constructed in 1909 by the Felten & Guilleaume Co. (Carlswerk). The amount in question is 67575 (W), the transcating pagesitating a further call tion is £575,000, the transactions necessitating a further call on the unpaid share capital. As net profits, the accounts record the sum of £21,900, as compared with £14,200, and the dividend is 4 per cent. on the paid capital of £500,000, as contrasted with the same rate on £312,000 in the previous

year.

The report of Meirowsky & Co., of Porz, Cologne, whose manufactures comprise insulation materials, condensers, etc., records a satisfactory course of business down to the outbreak of the war, when the turnover considerably declined, partly owing to many vetos imposed on exports even to neutral countries. As a consequence of the particular classes of manufactures made, it was impossible to obtain compensation through the production of war material. The gross profits decreased from £63,000 in 1913 to £40,000 last year, and the net profits from £29,000 to £23,000, the dividend on the share capital of £150,000 also falling from 12 per cent. to 9 per cent.

in the two years respectively.

The directors of the Bergmann Elektrizitats Werke, of Berlin, whose financial results were recorded on May 21st, report that the slackening in the general economic situation, which was in progress in 1914, did not materially prejudice the company's activity until August, when stagnation in the export trade and restrictions in working on peace manufactures took place. But in the final two months of the year, after overwhing the difficulties aggoritated with the advantage of overwhing coming the difficulties associated with the adoption of every

place. But in the final two months of the year, after overnew method of manufacture, an increased efficiency was
reached in the departments which were organised for war
work, and the number of workers, despite the calling of
1.645 to the colours, was brought at the end of 1914 to the
level which prevailed at the close of July. At the general
meeting, held on May 29th, it was announced that the orders
on hand would provide work for months forward, and that
work was being carried on day and night and on Sundays.

The report of Hartmann und Braun, of Frankfort-on-Main,
states that the earning conditions were greatly influenced by
the war, as a considerable portion of the company's manufactures were for export, and hostile countries were mostly
concerned in this respect. Although the mechanical workshops were not essentially equipped with the larger machine
tools necessary for the manufacture of war material, it was
possible for the company, after some time of diminished activity, to return to normal conditions and even to increased
working to some extent. The accounts indicate gross profits
of £88,000, as against £100,000 in 1913. After defraying general
expenses, interest on loans for £103,000, and setting aside
£12,000 in 1913 and a dividend of 8 per cent, has been £12,000 for depreciation as compared with £17,000, as against £27,800 in 1913, and a dividend of 8 per cent. has been declared on the share capital of £85,000, as contrasted with 19 per cent. in each of the four preceding years.

#### Rangoon Electric Tramway and Supply Co., Ltd.

THE directors report that during 1914 the cars travelled 1.482,478 miles, a decrease of 17,282, and carried 11,138,948 passengers, a decrease of 288,608. The total receipts were Rs. 8.82,917, a decrease of Rs. 49,035, or 5.2 per cent. Up to the outbreak of war the monthly receipts showed a gain of to the outbreak of war the monthly receipts showed a gain of Rs. 19,282 and under normal conditions the rate of increase would have been continued. Confidence among the Burmese and the natives of India is gradually being restored, and an improvement in the traffic is now observable. Motor omnibus traffic (593,722 passengers) has been maintained, the gross receipts being Rs. 39,762, and the expenses Rs. 42,814. This department is in its infancy, and a slight loss is not surprising. The 'buses are expected to act as a valuable feeder to the trainways. The gross receipts for current supplied for private lighting and power were Rs. 6.43,539, an increase of 11.52 per cent. The working expenses were 43.14 per cent of the receipts, as against 42.16 per cent in 1913. The gross receipts of the house wiring and supply department were Rs. 1.52,699, and the profit was Rs. 25,343, as compared with Rs. 22,478 in 1913. The gross profits were £62,453 plus £1,168 for transfer fees and interest. This is disposed of as follows:—Interest on debenture stock (£13,119); 4½ per cent. debenture stock redemption provision, £6,100; depreciation on sundry assets in Rangoon, £1,767; reserve for renewals, £12,500; special reserve for cables, etc., £2,000; and other items making £41,600, leaving a net profit of £22,021 plus £1,055 brought forward. After paying preference dividend £15,000 and 3 per cent, on the ordinary shares, £2,760 is to be carried forward. An alteration of the articles is proposed extending the period An alteration of the articles is proposed extending the period for the presentation of the accounts. A provident fund of which all employés under written agreements will be com-pelled to become members has been established. The subwhich all employes under written agreements will be compelled to become members has been established. The subscription is 5 per cent, of salary, the company contributing £500 each year in which a dividend is paid on the ordinary shares. Messrs. S. Balthazar, F. Tobin and J. Taylor have resigned their seats on the board. Mr. J. Glynn, of Liverpool, has been elected a director, and Col. A. C. de L. Joly de Lotinière and Mr. H. D. Dickie are recommended as directors. Sir F. W. R. Fryer, K.C.S.I., formerly Lieut.-Governor of Burma has accepted the chairmanship rendered vacant by the resignation of Mr. Tobin.

Annual meeting, June 23rd.

### New General Traction Co., Ltd.

The annual meeting was held on Tuesday at the offices, 8, The annual meeting was held on Thesday at the offices, 8, Crosby Square, E.C. Baron Emile B. D'Erlanger, who presided, said it was a rare pleasure in these days to be able to preside over the meeting of a joint-stock company and to be able to say that the results had been but little affected by the war. Fortunately, that was so in their case, and after paying the same dividend as last year, viz., 4 per cent., they were able to carry forward \$47.081, against \$6.500 brought into the account. The war had adversely affected the Douglas Southern Electric Transvays Ltd. in which they held a certain interest. able to carry forward £7,081, against £6,500 brought into the account. The war had adversely affected the Douglas Southern Electric Tramways, Ltd., in which they held a certain interest. That company had experienced a large falling off in revenue, and had only paid a dividend of 1½ per cent. last year; and he was afraid they could not look forward to any dividend for the current year. Fortunately, their holding in that company was only a small one, and, although they might be deprived of any revenue next year from that source, it would only affect them slightly. As regarded the Norwich Tramways, the receipts had been practically unaffected by the war, although the services had been curtailed through the early closing hours. Last year they obtained a valuable franchise for the extension of the trainways in Norwich, but owing to the difficulty in obtaining labour consequent upon the war the extension of the trainways in Norwich, but owing to the difficulty in obtaining labour consequent upon the war the work had been suspended by agreement with the Corporation, and it was impossible to say when it would be resumed.

Mr. C. Pakeman seconded the motion, which was carried unanimously.

#### British Electric Traction Co., Ltd.

THE report for the year ended March 31st, 1915, states that the progress of the associated companies in regard to trainway and omnibus traffic, and the sale of electricity, continued to be satisfactory up to the declaration of war. The disturbance in the business which then took place adversely affected the receipts of most of the undertakings, especially those which relied upon holiday traffics. On the other hand, the receipts of certain undertakings have increased during the war owing to exceptional activities in the districts in which they operate. and during the last lew months many of the other under-takings have shown some recovery. Having regard to the and during the last Iew months many of the other undertakings have shown some recovery. Having regard to the general conditions which prevailed during the greater part of the year, the board have not undertaken new enterprises involving commitments of any magnitude. The existing businesses of the associated companies, however, have been fully maintained and consolidated, and in some cases extended. Negotiations for the improvement in the tenure of certain of the associated companies are in progress. An agreement has been entered into for the sale of the trainway undertaking of the Devonport and District Trainways Co, to the Plymouth Corporation at a price to be settled by arbitration, and is now before Parliament for confirmation. The gross profit amounts to £235,508, as compared with £225,754 for 1913-1914. After deducting the general expenses there remains £209,295, plus £17,100 brought forward. Deducting debenture stock interest (£91,367) there remains £135,057. The revenue account has been debited with £11,191 for additional reserves interest (£91,367) there remains £135,057. The revenue account has been debited with £11,191 for additional reserves against sundry assets. The directors recommend the payment of the dividend for the year upon the 6 per cent, cumulative preference stock, and a dividend of 31 per cent, upon the 7 per cent, non-cumulative preference stock, together amounting to £52,467, being dividends at the same rate as those paid for the preceding year. This leaves a balance of £71,399, and in view of the directors' proposal to proceed with the reducement of the and re-arrangement of capital, it is not proposed to place any portion of this amount to reserve for depreciation, but to any portion of this amount to reserve for depreciation, but to

carry the whole amount forward. During the year investments of the book value of £59,379 have been sold at a net loss of £117. The revenue from the investments and undertakings amounted to £217,184, as compared with £209,045 in the previous year. The yield for the past year on £4,771,842 was 4.55 per cent., as compared with 4.47 per cent. for the preceding year on £4,672,458. The reserve against depreciation of investments is now £482,162, which is deducted from the amount at which the investments and undertakings stand in the books. There are additional reserves of £61,666 against other assets, and a halance of unallocated revenue amounting other assets, and a balance of unallocated revenue amounting to £71,399, which it is proposed to carry forward. The directors are of opinion that, subject to some small modifications, the are of opinion that, subject to some small modifications, the scheme for reduction and re-arrangement of capital should now be proceeded with, and they propose to call the necessary meetings at an early date. Mr. J. S. Raworth, who has been a director since the formation of the company, has resigned his seat at the board, but his services have been retained by the company as technical adviser. Mr. Alfred Shepherd has been appointed to fill the vacancy.
Annual meeting: June 25th.

#### Aluminium Corporation, Ltd.

In their report for 1914 the directors state that notwithstanding that the rainfall during the year was not sufficient to enable the works to be carried on at their full capacity during the whole period, together with the adverse conditions created by the war, they record a further increase in gross profits. After providing for debenture interests and other charges, the net profits amount to £7.812, plus £120 brought forward. There is to be applied in writing off depreciation on plant and machinery £3.394, and on buildings account £1,252, leaving £3.286 to carry forward. The contractor having failed to fulfil his contract for the construction of the tunnel to bring the Dulyn water into the Eigiau Lake, the compelition of the tunnel has been seriously delayed, but the company has now undertaken the work and satisfactory progress is being made. With a view to providing the necessary capital to extend the company's water power, etc., the directors have considered it expedient to increase the first mortgage debenture stock from £50,000 to £150,000. The chairman of the company (Mr. K. M. Clark) has taken up the increased stock to the extent of £15,000 in satisfaction of his loans to the company, and since the close of the accounts, has also agreed to take up an additional £10,000 of the increased stock in lieu of his second debentures, which became redeemable in April last. It is proposed to offer the balance of the increased debenture stock to the shareholders pro rata to their holdings. In accordance with resolutions passed, the rights relative to the participating shares have been revised.

Annual meeting: June 17th. In their report for 1914 the directors state that notwithstand-

Annual meeting: June 17th.

#### United Electric Tramways of Monte Video, Ltd.

THE annual meeting was held on Monday at Winchester House, E.C., Mr. G. A. TOUCHE, M.P., presiding. The Chair-MAN said he had not a very cheerful story to give, as Uruguay, MAN said he had not a very cheerful story to give, as Oruguay, in common with all South American States, had been passing through a period of adversity. The situation had been one of much difficulty. The commercial depression which made the previous year's operations unsatisfactory was continued and aggravated during the year under review. It could not be attributed to the war, although that accentuated the difficulties. Its origin lay in other causes, partly economic and partly climatic. To most their financial engagements could not be attributed to the war, although that accentuated the difficulties. Its origin lay in other causes, partly economic and partly climatic. To meet their financial engagements the Government had found it necessary to create internal debts bearing high interest. Bad times financially were bound to operate unfavourably on their traffics. But missifortune did not come alone, and the elements also conspired to make things unpleasant. Continuous bad weather prevailed, and the country was visited by several violent cyclones, which not only paralysed traffic for hours—in some cases days—but involved expense for repairs to the company's preperty. The board had also had many anxious questions to deal with from the expense point of view. The traffic receipts for the year were £361,465, a decline of £12,061, or 3.23 per cent. The last three months of the year—the period covered by the war—were accountable for more than two-thirds of the total decrease. The number of passengers carried decreased by 759,841 to 43,862,849. Operating expenses were 60,86 per cent, of the gross receipts, an increase of 1.28 per cent. This was an actual decrease in the amount of expenses of £2,553, but it would have required a further decrease of £1,626 to maintain the same ratio of expenses to receipts. That was impossible of achievement. The year had to bear exceptional expenditure resulting from the storms and cyclones, and the resulting floods, amounting to £3,164. There was an unavoidable additional loss of £745 in the discounting of nickel and silver currency, and an increase in and cyclones, and the resulting hoots, absoluting to £3.00. There was an unavoidable additional loss of £745 in the discounting of nickel and silver currency, and an increase in maintenance charges of cars and permanent way of £1.125. Those items, totalling £5.014, represented more than the further decrease of £4.626 required to maintain a steady ratio of working extenses. Every care was taken to counteract the working expenses. Every care was taken to counteract the decrease in receipts, and important economies were effected. The principal of these economies was in the consumption of

electric current. To accomplish this purpose a very strict system of instruction and supervision of the drivers had been instituted. The net traffic receipts for the year were £141,477, a decrease of £9,508, or 6.30 per cent. The total credits to profit and loss account amounted to £135,858, a decrease of £11,826. The profit and loss account charges amounted to £58,823, an increase of £2,420. This was more than accounted for by the increases of debenture stock interest, viz., £1,920, and income tax £2,440. The net profit for the year was £77,035, plus £12,641 brought forward, making a total of £89,676. This was proposed to be dealt with as follows:—£3,370 had been set aside for redemption of debenture stock, and £2,500 towards redemption of the share capital; £25,000 had been added to the renewals and contingency account, making the total set aside for that purpose to date £155,000, out of which a sum of £15,832 had been written off, leaving a balance of £139,168. For four consecutive years they had paid 7 per cent. on the ordinary shares, so that a reduction to 4 per cent, was disappointing, but not surprising to those who knew the severity of the crisis through which South America was passing. The capital expenditure for the year totalled £50,610, compared with £122,158 in the previous year. In view of the big fall in revenue and the serious outlook, all expenditure of a capital nature had, as far as possible, been rigorously curtailed. The completion of the two substation buildings and the installation of the necessary plant practically accounted for the whole of the expenditure during the year. A considerable sum (about £20,000) would be required for additional rolling stock on order, but not delivered. A further issue of capital would be required in the future A considerable sum (about £20,000) would be required for additional rolling stock on order, but not delivered. A further issue of capital would be required in the future (when the British Treasury rules permitted), for the company must look to some continuing expenditure, governed, in pany must look to some continuing expenditure, governed, in part, by the development of the city, and in part by the programme of the municipality, especially as regards paying. Coming to the results for the first six months of the current year, frankness compelled him to tell them that the position was worse. None of the adverse conditions had yet disappeared; financial depression continued; weather conditions throughout the summer season had been bad, four months of the six being classed as rainy, and the remaining two as unsettled. Expenses were increasing in some directions in an unpresix being classed as rainy, and the remaining two as unsettled. Expenses were increasing, in some directions in an unprecedented degree. The price of coal had risen, and freight had doubled, so that their coal bill—always a heavy item, would this year be exceptionally large. The actual figures for the half-year were: Traffic receipts—1915, £174,655; 1914, £200,181, a decrease of £25,526; net receipts—1915, £68,311; 1914, £88,005, a decrease of £19,784. It was difficult to foresee what would transpire during the second half of the year now current. The worst might be nearly over, for they would soon arrive at a time when the takings would begin to compare with the months of last year that showed the heavy decreases. They were clearly in for a bad year. The tide was still on the ebb, but it might turn before long, and when it did the flow, if not so rapid as the ebb, might be very pronounced. There were several factors making for a return of prosperity. There was the practice of individual thrift, while war conditions had established a stendy market at favourable prices for pastoral and saladero produce, such as cattle and sheep, wheat pastoral and saladero produce, such as cattle and sheep, wheat and maize. With diminished expenditure and imports and better prices for exports, gold would flow into the country. Already the improvement in South America was beginning to manifest itself in portions of the Argentine. In some respects Uruguay was a little later than Argentina in feeling the

pects Original was a little later than Argentina in reeling the full force of the decline, and she might be later also in experiencing the full benefit of the recovery.

Mr. H. F. Gunning seconded the motion.

Replying to a shareholder, the Chairman said they had been experimenting with oil fuel, and were still doing so, but the trouble was the question of supply at advantageous prices.

The report wing advanted

The report was adopted.

India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.—As foreshadowed in the chairman's remarks at the the half-yearly meeting in June last, it has been decided to abandon the half-yearly meeting, a course pursued by many other companies during the war. In announcing this fact the directors report that the naif-yearly meeting, a course pursued by many other companies during the war. In announcing this fact the directors report that the works at Silvertown are very busy in many departments, and it is hoped that the year's results will be favourable, though the prices of labour and coal are considerably higher than last'year owing to the war. The cable-ship Dacia has had considerable employment, and the board has reason to expect a continuance of it. The French works were closed entirely for several modes during employment, and the board has reason to expect a continuance of it. The French works were closed entirely for several weeks during last year on account of the close proximity of the German Army. As stated in the directors' report for last year, before the war broke out the organisation had been placed on a thoroughly sound basis, and the works, although greatly hampered by the shortage of labour, are now doing a sound and steady business. The directors have decided to distribute a dividend of 5s, per share, less incometax, on the preference shares, being the half-yearly dividend due on July 1st, at the rate of 5 per cent. per annum; and a dividend of 5s, per share, free of income-tax, on the ordinary shares, being an interim dividend of  $2\frac{1}{2}$  per cent.

Shawinigan Water and Power Co.-A dividend of 13 per cent, on the common stock for the quarter ending June 30th is announced.

Montreal Light, Heat and Power Co.—The report for 1914 states that the net revenue was 3,085,907 dols. which, after deducting fixed charges (489,164 dols.), leaves the net income 2,596,743 dols. Dividends to the amount of 1,827,500 dols, have already been paid and 10,000 dols, have been appropriated to the officers' and employes' pension fund, leaving 759,243 dols, to be transferred to general surplus. The increases in surplus earnings have accorded mostly from the operations of the earlier part of the year, and while the effects of the disturbed business conditions resulting from the war have not been so serious as for most industries, the effects of the depression have been distinctly felt in the unusually large number of disconnections and the increase in bad debts, the latter of which amounted to more than three times that of any previous year. The outlook for the coming year is not as bright as usual, and is aggravated by the fact that large expenditures for wax taxes on imported raw materials and supplies have to be faced.

New British Ever-Ready Co., Ltd.—At the annual meeting held at the works, Hercules Place, Holloway, N., on June 7th, the directors reported that for the year ended March 31st, 1915, the profit available for distribution, including £859 brought forward, and after writing off depreciation, balance of preliminary expenses, &c., and transferring £5,000 to general reserve, amounted to £29,958. An interim dividend was declared and paid on the preference shares on December 1st, 1914, amounting to £2,975. The directors now recommended a final dividend on the preference shares at the rate of 6½ per cent. per annum, making the maximum of 10 per cent. for the year, requiring £5,525, and after payment of 10 per cent., and a bonus of 2 per cent. on the ordinary shares for the year, £7,658 is carried forward.

James Keith & Blackman Co., Ltd.—According to the Financial Times the net profit for the past year was £13,302. A dividend of 10 per cent., tax free, on the ordinary shares is to be paid.

Automatic Telephone Manufacturing Co., Ltd.-The share and transfer books will be closed from 17th to 24th inst. inclusive, for the purpose of preparing the dividend warrants on the 6 per cent. preference shares for the half-year.

National Electric Supply Co., Ltd.—Interim dividend 2s. 6d. per share, less income-tax, on the ordinary shares for the half-year.

Vulcan Boiler and General Insurance Co., Ltd. An interim dividend at the rate of 18 per cent, per annum is announced for the half-year.

#### STOCKS AND SHARES.

Tuesday Evening.

Stock Exchange markets are awaiting news with reference to the next War Loan. That some sort of issue is contemplated in the near future, the House regards as assured; and the debate in the House of Commons to-night (Tuesday), on the Vote of Credit, is expected to produce some sort of hint as to the Government's intentions. Money is plentiful enough, and there is still a demand for good-class stocks paying reasonable rates of interest. Something of a feature is the revival in the rubber share market, in consequence of the steady climb in the price of the raw stuff. Another feature this week has been sharp recovery in Underground Electric income bonds. The stocks and shares connected with the Electricity Supply companies are exceedingly quiet.

The income bonds of the Underground Electric Railways have recovered 5 of the 61 points which they shed last week, and the price moved up to 75 as abruptly as it had dropped from that figure to 70. Pressure to sell has been removed, and a few buyers who came in with timid orders, in amounts of one and two hundreds, found that their intended operations had a remarkable effect. A good deal of business is doing in the bonds, and the contention advanced here last week that the fall was considerably overdone, while it was good at the time of writing, turned out to be too late to advantage readers, inasmuch as the recovery had started before this paper was published on Friday morning last. There is a small improvement to record in the Company's 1s. shares, but the £10 issue remains at 25s

Districts had a sharp drop to 141, and so far have failed to recover. Metropolitans eased off to 281, and Steam stocks are weak throughout, mainly on account of the fear that coal contracts, which have to be revised at the end of this month, will be effected at prices very different from those ruling previously. An advance of about 6s. per ton is expected to be, roughly speaking, the average addition to the companies' fuel

This question of fuel affects, of course, illumination companies as well as the railways, and prices in the gas market are heavy. Amongst electricity shares, no changes have occurred since our last notes appeared; and the buyers who recently have been on the look out for cheap stock are still occupying the same position. It is said that most undertakings connected with the supply both of gas and electricity are being asked to adapt part, of their machinery for the purposes of munitions, and it may be that this side-branch will be of useful assistance to the companies during the slackest period of the year. Business is quiet.

The British Electric Traction Co. repeats its previous dividend performance by declaring 3½ per cent. on the 7 per cent. non-cumulative preference stock, and this has caused a demand for all six of the Company's stocks. Prices are nominal, in the sense that there is scarcely any supply to be obtained, holders preferring to keep their investments, and, if anything, wishing to increase-rather than to realise them. Therefore the 6 per cent. cumulative preference is up to 70, the 7 per cent. non-cumulative has risen to 35, the preferred and deferred to 10 and 5 respectively. B.E.T. 5 per cent. debenture stock is 87, and the 4½ per cent. second debenture stock, which has not changed hands for over six weeks, is called 75. For 1914, as already observed, the Company paid 3½ per cent. on the 7 per cent. non-cumulative preference stock, which was an improvement of ½ per cent. on the distribution for the previous twelvemonth.

The Victoria Falls and Transvaal Power Company has declared a dividend at the rate of 6 per cent, per annum for ten months on the preference shares, so clearing off all the arrears up to the end of April, 1914. This is a better result than had been expected, and the price of the shares improved to 15s. 6d., while the 5½ per cent, second mortgage debentures are a little better at 88½. The latter price, by the way, is 5½ points above the quotation of the debentures when war broke out; and the preference shares now stand about a florin higher than they did at that time.

Brazil Tractions are a jumpy market, and from 54, on Friday, they fell to 51½ to-day (Tuesday), the price moving in sympathy with the Rio rate of exchange. This touched nearly 1s. 1d. before it reacted a little. Mexican Industrials show slightly hardening tendency, on the publication of the United States Note to Germany; this has been read as an indication that America has no intention of embroiling herself in the European struggle, and therefore may have the greater inclination to intervene in the cause of straightening out affairs in Mexico.

Anglo-Argentine Trams have improved a little as regards the 1st preference and the 4 per cent. debenture stock, though the Fives are \( \frac{1}{2} \) lower. A reassuring statement from the Central Argentine Railway says that the exodus of Italians from the Republic is not considerable, and it is hoped that, even if it increases, prejudicial influence will not be exercised thereby. Upon this, most securities connected with Argentina have braced up.

braced up.

In the Telegraph market, Westerns gave way \(\frac{1}{4}\) to 13\(\frac{1}{4}\), notwithstanding the declaration of the third quarterly interim dividend of 3s. per share, as usual. Anglo-American Telegraphs are better, thanks to a marked improvement which has occurred in most issues connected with the United States. The Eastern group is a little dull. Good business is taking place in Marconis, for which optimistic dividend anticipations continue to act as the principal stimulus. Oriental Telephones gained the fraction at 2\(\frac{1}{4}\), while, on the other hand, United River Plate Telephones_eased off to 6 on the appearance of a small seller.

Callender's Cable shares have come in, on account, it is

Callender's Cable shares have come in, on account, it is said, of a deceased estate; the price weakened \(\frac{1}{4}\) to 11\(\frac{1}{2}\), at which it will be noticed that the yield is the excellent one of six guineas per cent. Henley's have hardened to 14\(\frac{1}{4}\), which makes the return on their shares \(\pmu7\) 18s. 8d. per cent.; so that the previous difference of 42s, in the return is being diminished. General Electric preference gave way to 10. Liverpool is buying British Aluminium ordinary and preference; and although the nominal prices show comparatively little change, the market is a strong one, and there is not much floating supply. British Insulateds are firm at 11\(\frac{1}{4}\), and India Rubber shares at 9, while Babcock & Wilcox continue to change hands on the basis of 50s.

In the rubber market, as already indicated, there is noticeable strength and an unusual amount of animation. The price

In the rubber market, as already indicated, there is noticeable strength and an unusual amount of animation. The price of the raw article is now close to half-a-crown per lb., and company after company shows that it can make highly satisfactory profits at anything like this figure. Attention for the time being is directed principally to the younger companies with large estates at present not wholly in bearing, the argument being that as their prices stand relatively and substantially lower than those of the more mature undertakings, there is considerably more scope for advance in dividends and capital value than the seniors can expect. The buying movement proceeds from the provincial centres as well as from London itself; and so long as the price of rubber keeps good, it is safe to prophesy that the share market will remain robust. Armament shares are quiet, unaffected in any way by the fiery eloquence of the Minister of Munitions. From the purely market point of view, his demand for more shells, and ever more shells, is countered by the knowledge that war profits are not going to be permitted to assume extravagant proportions.

^{*} Allowance made for dividends being paid free of income-tax.

Victoria Falls and Transvaal Power Co., Ltd.— The directors have declared a 10 months dividend at the rate of 6 per cent. per annum, less income-tax, on the preference shares, thereby making the cumulative dividend paid up to April 30th, 1914.

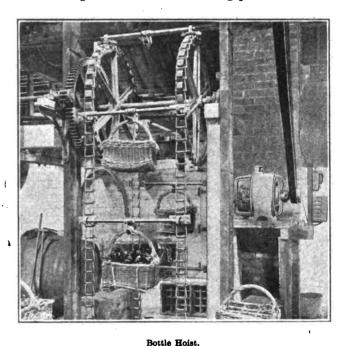

#### FARMING.—III. **ELECTRICITY** IN

ALTHOUGH somewhat beyond the scope of this article, we may mention that electric lighting and "other uses" of electricity have made great progress in Hereford, which, as a country and market town, possessing a fine cathedral and historical associations extending back some 800 years, is a

and it will undoubtedly be adopted both in the city and by the larger houses served in conjunction with the farms. The electricity department has also taken the first steps to introduce the electric vehicle in Hereford, by using a light electric truck for its own work about the town, and we gather that inquiries for delivery vans of this type have resulted.

This brings us to another interesting point; successful

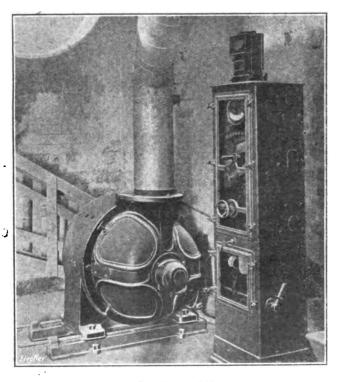

Aerating Machinery.

ELECTRIC DRIVING IN CIDER MILL, HEREFORD.

favoured residential centre. Practically every public building is electrically lighted; this applies to all the churches and the cathedral, in which the Gilbert Scott lighting fittings have been converted and some 360 lamps are installed.

As regards "other uses," about 120 kw. of electric heating and cooking apparatus is in use in the city, including as have been the initial efforts to supply outlying farms and houses, there is a limit to the load which can be taken on the low-pressure direct-current overhead lines, and the increasing demands for electric power, lighting, cooking by those adjacent to the transmission routes has led Mr. Kerr to formulate a much more ambitious scheme—which is, unfortunately, deferred, owing to the war-by means of which

85-н.р. Pipe-Ventilated Motor.

ELECTRICAL FLOUR MILL DRIVES, HEREFORD.

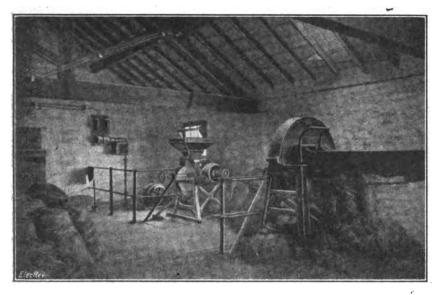

about 200 irons; six consumers have adopted electric cooking and heating extensively, but pending improved manufacturing methods in the way of standardised replacements, &c., this branch of the supply business is not being pushed. Still, where used, electric cooking is giving satisfaction,

the supply will be available anywhere within a five-mileradius.

This anticipates the installation of a 1,250-kw. threephase turbine plant to supply current at 3,300 volts pressure by means of overhead transmission in the surrounding

districts. It is estimated that the saving in fuel cost alone over the existing plant would justify the departure, and that very many farming and other consumers would become accessible to the undertaking.

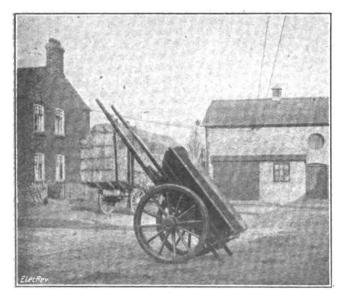

MOTOR AND FOOD-PREPARING MACHINERY ON AN ALTRINCHIM FARM.

We are much indebted to Mr. Kerr for discussing the peculiar supply problems of the Hereford area with us; the results which he has achieved, and the methods adopted to secure them, deserve the careful study of all central station engineers situated in, and mainly dependent on, an agricultural area for future success.

Farm Supply at Altrincham.—The Altrincham Electric Supply, Ltd., has recently given a supply to a local 285-acre farm, where about 30 lights are installed in the house, all farm buildings and yard, and only electricity is used. The entire farm plant, including a corn mill, chaff cutter, root pulper, cake mill, &c., is driven by a 7½-B.H.P. 100-volt single-phase motor fixed in the granary.

The wiring in the farm buildings is generally in porcelain cleats on the surface, and the farm is supplied at 2,000 volts, 80 cycles, through half a mile of concentric cable laid across the consumer's land, at about 2-ft. depth, the pressure being transformed down to 100 volts, and metered at the farm. The consumer pays 6d. per unit for lighting and 1½d. for power, and it is understood that he would have been well satisfied if his first quarter's bill had been three times as large, despite the fact that it was swollen by sundry demonstrations for the edification of neighbouring farmers.

FARMYARD WIBING, ALTRINCHAM.

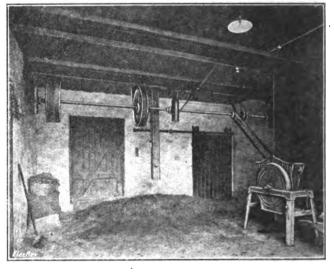

This installation was responsible for another farmer taking a supply for lighting and power from the company within a month.

We are indebted to Mr. Fawcus, the chief engineer of the company, for these particulars and accompanying views; we gather that he also is favourably impressed with the prospects for farm supply in his district.

Sufficient has been said to indicate that this subject has a real interest to a numerous class of supply engineers in this country, who have been, figuratively speaking, "all out of it," in comparison with their more fortunate brethren in factory or industrial centres.

But reverting to an earlier remark, it is necessary in the first instance to convince the farmer, whose educational intervals are not numerous, and more particularly confined to agricultural shows.

The steam and oil engine manufacturers make the utmost of these occasions, but we believe that electrical exhibits are conspicuously absent, and a co-operative electrical farming exhibit on American lines, such as that described in our pages on August 23rd, 1912, or that which formed a feature of the Christiania Exhibition, and was referred to in our issue of August 14th last, is a thing unheard of here.

DRIVE FOR PULPING MACHINE; ELECTRIC WIRING, &c.

Testimony to the value of the "personal demonstration" comes from far-off New Zealand, where the farmer shareholders of the Tai Tapu Co-operative Dairy Co., as a result of a short experience of its electrical operation—made possible by the advent of hydro-electric power—decided that they must have electric light and power on their own farms, and a scheme for that purpose has been organised.

Almost every house and farm in the district has decided to use electric light, and numerous shearing plants and a dozen milking plants are to be connected, while one farm is adopting electric cooking and heating throughout.

Three overhead lines covering 12 miles of route will couple the factory, which will be a central distribution point, and consumers; the latter average four per mile, and will be charged at fixed rates, no meters being used.

The question of method of charging is important; under the fixed-rate system the farmer knows exactly what his electricity is going to cost him, and this is what a good many English farmers will want to know, although they may have only the haziest idea as to the cost of running a steam plant for similar work.

In this country such rates as 6d. per unit for lighting and 2d. to 2½d. per unit for power are really an attractive proposition to the farmer, but it is advisable to offer a sliding scale down to the 1d. rate, which the farmer may calculate on reaching, even though in practice he never does so.

In conclusion, it seems obvious that good results are almost

certain to be obtained by demonstrating to the farmer what can be done by electricity, and arrangements should be m de between the agricultural machinery and electric manufacturers to carry out this work at agricultural shows, &c.

We would suggest that this matter is sufficiently important to attract the attention of the I.M.E.A., many of the members of which body are situated in agricultural areas which must of necessity be made to yield some revenue in the future if the supply undertakings are to maintain a reasonable rate of progress. The fact that at least a quarter of the undertakings in the county fall within this category is significant.

### ECONOMIC OPERATION OF ELECTRIC OVENS.

BY PERCY WILCOX GUMAER.

Even to-day very little is known of the proper conditions of EVEN to-day very little is known of the proper conditions of time and temperature to use in cooking various articles of food so as to secure the greatest efficiency. With electric cooking the temperature at which food is cooked makes a considerable difference in the cost of the cooking.

In order to determine the losses of energy in electric cooking and the best methods of preparing various articles of food in electric ovens, tests were made on three commercial ovens and

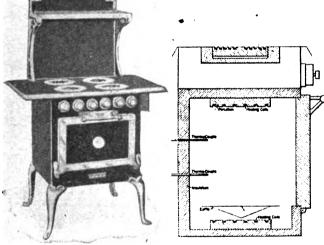

Fig. 1.—Oven No. 1.

Fig. 2.—Cross-section of Oven No. 1.

an experimental oven. Each commercial oven was selected as representing a general type of electric oven in use for domestic

cooking.

Oven No. 1, as shown in fig. 1, is a large range suitable for a good size family. The inside dimensions of the oven arc 12

of two heating coils controlled from a snap switch on the front of the oven so as to consume 220, 440, or 880 watts. From one to two inches of mineral wool is used as heat insulation. The outside surface of the oven is blued steel with nickeled legs and trimmings. The oven door is 12 by 18 in. and 1.5 in. thick. It fits tightly and clamps securely in place when shut. Three heating units are also placed on top of the stove for the cooking which is not done in the oven. Fig. 2 is a cross-section of the oven showing the position of the heating coils and the thermocouples used to measure the temperature.

Oven No. 2, as shown in fig. 3, is a small well insulated oven suitable for a small or medium size family. The inside dimensions of the oven are 9.5 in. wide, 10 in. deep, and 12 in. high. The inside finish is seamless drawn alumnium, and the outside is blued steel with nickeled trimmings. Two and one-half inches of mineral wool is used for heat insulation. An ironclad heating element is placed in the bottom of the oven, and

inches of mineral wool is used for heat insulation. An iron-clad heating element is placed in the bottom of the oven, and consumes 500 watts when connected to a 110-volt circuit. The heat cannot be turned partly off, as there is only one heat-ing element. Underneath the oven is an automatic tempera-ture control, which may be set at various values by means of a dial. The dial is graduated in arbitrary numbers from one to eleven. When the handle of the dial is set at a given number a thermostat will open the circuit of the heating element as soon as the inside of the oven has reached a certain temperature; as the oven cools the thermostat must be reset by hand by pushing the handle of the dial. Fig. 4 is a cross-section of the oven showing the position of the heating coil and the thermo-couple.

over No. 3 is one of the well-known makes of fireless cookers with a heating element placed underneath the inner lining. The inside dimensions are 10.5 in. deep and 12.5 in. diameter. The inside lining is seamless drawn aluminium, and the outside finish is varnished oak. The sides and bottom are insulated with powdered kieselembra, while the cover is insulated with

finish is varnished oak. The sides and bottom are insulated with powdered kieselguhr, while the cover is insulated with granulated cork. Fig. 5 is a cross-section of the oven showing the position of the thermo-couple and heating coil. The oven uses 500 watts at 110 volts. There is no method of turning the oven partly off.

Oven No. 4 was constructed by the author so as to obtain data on the characteristics of an especially well insulated oven. The inside dimensions were the same as oven No. 2. A 220-, 440-, 880-watt heating unit was placed in the bottom of the oven and a 440-watt unit in the top as shown in fig. 6. Sheet iron was used for the inside lining. A 4-in, layer of a commercial brand of diatominous insulating brick was used for insulation. Later 4 in, of cork board was added as shown in the drawing. This was put on with cement, and no outside covering was used except on the front and the door, which were covered with wood.

The temperature of the ovens was measured by means of copper-constantan thermo-couples.

The temperature of the ovens was measured by means of copper-constantan thermo-couples.

In oven No. 1 an extra thermo-couple was inserted for measuring the internal temperature of food.

The effect of heat on the protein of foods is to coagulate it. This change occurs at the comparatively low temperature of 75 deg. C. If the temperature is increased much above this point the protein tends to shrink and harden, and the digestibility of the food is greatly lessened thereby.

The effect of heat on the starch of foods is to make it more digestible. The starch is gelatinized at temperatures much below the boiling point of water.

The fat of foods is practically unaffected chemically by the degree of heat used in cooking.

The ideal preparation of food for human use requires that the nutriment which it contains shall be utilized to the fullest extent. Not only should the food be in such a state that the digestive juices can best act on it, but these digestive juices should be properly stimulated to do their work, by improving should be properly stimulated to do their work, by improving the taste or flavour of the food.

The present day problem is to determine the methods of cooking which will yield the most in nutrition and flavour with a minimum expenditure of fuel and labour.

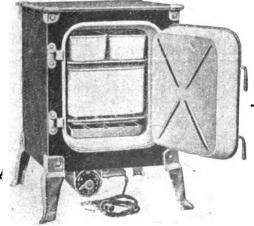

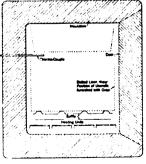

Fig. 3.—Oven No. 2.

-Cross-section of Fig. 4.-Oven No. 2.

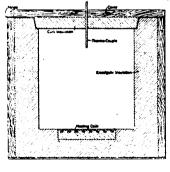

Fig. 5.—Cross-section of Oven No. 3.

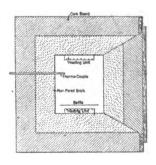

Fig. 6.—Cross-section of Oven No. 4.

in. by 12 in. by 18 in. Two heating units are used, one in the top and one in the bottom of the oven. Each unit consists

Except in a few localities, for the same number of heat units delivered at the meter, electricity is more expensive than gas or coal. Hence, it is only by studying carefully the most economical features of design and operation of electric cooking apparatus that electricity will be able to compete with gas

^{*} From the Proceedings of the American Institute of Elec-trical Engineers. Abstract.

and coal. A study of the heat losses in cooking is, therefore, of considerable importance to the designer of electric cooking apparatus.

apparatus.

Heat is lost in two ways—by convection and by radiation. The amount of energy radiated depends upon the nature of the surface, the temperature of the surface, and the temperature of the surroundings. It is independent of the shape of the radiating surface. The convection loss, however, depends

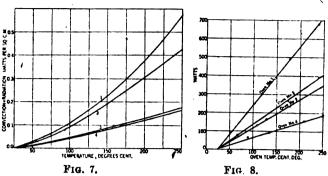

FIG. 7.—TOTAL LOSSES FROM HEATED SURFACES IN AIR.

Black body.
 Oxidized copper.

3. Pure silver.
4. Convection only.

Fig. 8.—Energy Required to Maintain Ovens at Constant TEMPERATURE.

upon the shape and the position of the surface, as well as the temperature of the surface and the surroundings. It is independent of the nature of the surface.

Fig. 7 shows the convection and radiation losses for vertical plane surfaces for temperatures up to 250 deg., the highest

plane surfaces for temperatures up to 250 deg., the highest used in cooking.

As shown by the curves, the radiation loss from a black body constitutes a large part of the total loss, while the radiation from a polished silver surface forms but a small part of the total loss. For all other surfaces the radiation loss lies between that of a silver surface and a black surface, the convection being the same for all surfaces.

Since the convection and vadiation losses depend on the

Since the convection and radiation losses depend on the temperature of the outside surface, the losses will be greatly reduced if this temperature can be decreased.

Suppose that enough heat insulation were introduced to reduce the outside temperature from 200 deg. to 110 deg. C., the watts lost per sq. cm. of outside surface would be reduced from 0.37 to 0.12.

Another method of reducing the heat losses would be to silver-plate the outside of the oven. The heat loss would then be decreased from 0.37 watt per sq. cm. to 0.13. By a combination of the two methods the input of the oven for a given internal temperature would be reduced from 1,000 watts to 165 metts. 165 watts.

To silver-plate the outside surface of an electric oven would To silver-plate the outside surface of an electric oven would be too expensive, but a white enamelled surface would be much more efficient than the black surface. A place in which nickel plating could be used to good advantage would be around the edge of the oven door, where the outside temperature of the oven is considerably higher than elsewhere.

The heat losses for the ovens tested were obtained, and curves were plotted between oven temperature and watts input as shown in fig. 8. These curves are very useful in comparing the economy of various ovens for the cooking of any article of food. Since one point of the curve will be zero

any article of food. Since one point of the curve will be zero energy at room temperature, only one determination is necessary to plot the curve for any particular oven.

The heat losses of an electric oven may be separated into the losses occurring before and after the food is inserted in

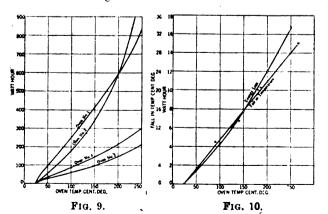

FIG. 9.—ENERGY REQUIRED TO PREHEAT OVENS.

Fig. 10.—Effect of Opening Door of Oven No. 1 for 15 sec., tion Energy Lost and Fall in Temperature of the Oven

the oven. In many kinds of cooking, such as baking biscuits and cake, the food must be placed in a hot oven as soon as it is prepared. The amount of energy required to preheat an

oven to the desired temperature depends on the insulation of the oven, its size and the thermal capacity of the inside, and the size of the heating coils. The amount of energy required to preheat the ovens tested is shown in fig. 9. It will be noticed that, although oven No. 4 was better insulated than oven No. 2, it required more energy for the preheating. This was probably due to the greater heat capacity of the inside lining and the insulation. The effect of too small a heating coil is shown by the curve for oven No. 3; the time required for the oven to reach a baking temperature of 250 deg. C. was 2.5 hours.

In preparing food which cannot be placed in a cold oven and heated gradually, there is a loss of heat when the oven door is opened. oven to the desired temperature depends on the insulation of

door is opened.

Fig. 10 shows the watt-hours lost each time the door of oven No. 1 is opened for 15 seconds, and the fall in temperature of the oven when the door is opened at different oven tempera-

Experiments have demonstrated that beef can be satisfactorily roasted at an oven temperature anywhere between 100 deg. and 200 deg. C. No difference was discernible in the tenderness of duplicate roasts cooked at the extremes of temperature. The most satisfactory temperature within this interval can be determined only by the consideration of other interval can be determined only by the consideration of other factors, of which the time of cooking and the cost of cooking are the most important. In order to determine this most economical temperature for roasting a rolled rib roast, a series of experiments were performed on 22 roasts. The meat was freed from bone and tightly rolled and secured with wooden skewers. Samples were roasted at 100, 120, 140, 160 and 180 deg. C. The time required for the cooking and the amount of energy used at each oven temperature were measured. From these values the most economical temperature was determined.

The aim in cooking meat is not to increase its digestibility

these values the most economical temperature was determined. The aim in cooking meat is not to increase its digestibility but to improve its flavour and appearance, by decomposing the red colouring matter called oxyhemoglobin, which removes the raw appearance of the meat. The inside of the roast should be heated sufficiently to accomplish this without overcoagulating the proteids or removing from the meat those substances which tend to become soluble or volatile upon the application of heat.

application of heat.

In order to secure as much uniformity as possible in the results, a definite internal temperature was taken as the indication of when the meat was sufficiently cooked: 55 deg. C. was used for rare, 65 deg. for medium rare, and 75 deg. for

A copper-constantan thermo-couple was used to measure the temperature inside the roasts.

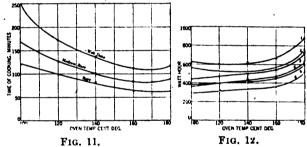

Fig. 11.—Effect of Oven Temperature on Time of Cooking of BEEF ROASTS.

FIG. 12.—ENERGY REQUIRED TO ROAST BEEF IN OVEN No. 2, STARTING WITH OVEN HOT AND WITH OVEN COLD.

Well done roast, oven cold. 4. Rare roast, oven cold.

""", "", ", het. 5. Med. rare roast, oven het.

Med. rare ", ", cold. 6. Rare roast, oven het.

3. Med. rare

The authorities on meat cooking recommend that a roast be cooked for the first 10 or 15 minutes at an oven temperature of 250 deg. C., so as to sear the outside of the meat. The theory is that the coagulation of the outer surfaces of the meat will act as a seal to keep in the meat juices and volatile flavours. A consideration of the heating curves of the electric ovens discussed in the first part of this paper shows that to heat an oven up to 250 deg. C. and to keep it there for 15 minutes will increase the cost of electricity for roasting the meat about 50 per cent. In order to reduce this extra cost of energy another method was tried which proved very successful. Instead of searing the meat in the oven at a high temperature it was seared on the top of the stove, or, rather, by placing the meat in an aluminium dish over an 880-want heating coil. The current was turned on for three minutes to get the dish quite hot. The meat was then placed in the hot dish and seared for ten minutes, being turned frequently so as to sear all sides.

After searing, an incision was made in the roast with a

so as to sear all sides.

After searing, an incision was made in the roast with a sharp narrow-bladed knife, and the thermo-couple was inserted as near as possible in the centre of the roast. The roast was then placed in the oven at the desired temperature. Placing the roast in the oven lowered the temperature by 10 to 20 deg. Full current was turned on until the temperature returned to the desired value; after that the temperature was kept constant within 2 deg. C.

When the temperature inside the roast indicated the meat to be cooked rare, the time and watt-hour readings were recorded. This was also done for medium rare and well done.

Fig. 11 shows the average time of cooking plotted against oven temperature. It will be noticed that at an oven temperature of 160 deg. C. the roasts are cooked in a shorter length of time than at 180 deg. This is probably due to the fact that the slightly charred surface of the meat is a poorer

renger of the that the slightly charred surface of the meat is a poorer conductor of heat.

The per cent, loss in weight of the roasts increases with the temperature. As far as the losses in cooking a well done roast are concerned, meat is best when cooked between 100 and 120 deg. C., or possibly lower.

The other important factor which determines the best roasting temperature is the cost of the electricity used. The curves of fig. 12 give the energy used in roasting beef in the oven No. 2. The additional energy used in searing the roasts was the same in all cases, 190 watt-hours. It will be noticed that for rare and medium roasts 100 deg. is the most economical temperature for well-done roasts lies between 120 and 140 deg. C.

The energy required for roasting meat in oven No. 1 is considerably greater than for oven No. 2. This is due partly to the smaller amount of heat insulation used and partly to the larger size of the oven.

The saving in energy in favour of searing on top of the

The saving in energy in favour of searing on top of the stove is surprisingly great, making a difference of \$.05 (at \$.05 per kw.-hr.) in the cost of preparing the roast.

A series of experiments were undertaken on the baking of biscuit, bread, and sponge cake, to determine the range of temperatures within which each article of food could be satisfactorily baked and the particular temperature within this interval which was the most economical for the ovens tested.

The range of temperature for baking biscuits was from 200 to 240 deg. C.

The range of temperature for baking discuits was from 200 to 240 deg. C.
Fig. 13 shows the minimum time of baking and the per cent. loss of weight curves for the bread experiments. The loaves averaged 300 gm. in weight and were baked in a tin the dimensions of which were 3 in. by 5 in. by 3 in. deep.
In the bread experiments the most satisfactory results were obtained above 180 deg. At the lower temperatures the crust

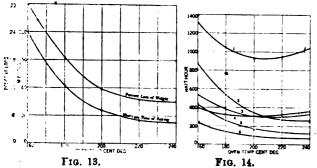

Fig. 13.—Effect of Oven Temperature on Time of Baking Bread and per cent. Loss of Weight.

FIG. 14.—ENERGY REQUIRED TO BAKE BREAD STARTING WITH OVEN HOT AND WITH OVEN COLD.

1.	Oven			cold.	******		Ov	en	No.		cold.
	,,	,,				5.	,	,	,,	2	hot.
3.	,,	,,	2	cold.		6.	,	,	,,	4	hot.

was hard and thick, due to excessive evaporation of moisture as indicated by the loss in weight curve. At 240 deg. the cutside of the loaf had a tendency to brown over before the

inside was thoroughly done.

The time required for baking a larger loaf would be some-

what longer.

The time required for baking a larger loaf would be somewhat longer.

The range of temperature for baking sponge cake lies between 170 and 200 deg. C.

If biscuits are baked immediately after other food is removed from the oven, so that preheating is not necessary, the energy required will be very small compared to the amount required if the oven has to be heated up from room temperature to baking temperature.

Because the conditions of baking biscuits satisfactorily are a high temperature for a short time, ovens used for this purpose should require as little energy as possible for preheating.

The curves of fig. 14 give the energy used in baking bread at the various oven temperatures with and without preheating. It will be noticed that for all the ovens the energy required is a minimum above 220 deg. The most economical temperature for baking bread when the oven is already heated is, therefore, from 220 to 240 deg. C.

The temperature for which the energy required is a minimum lies between 200 and 215 deg. C., depending on the oven used. Although the insulation of oven No. 4 is very much better than that of oven No. 2, it will be noticed that above 205 deg. oven No. 4 requires more energy for baking bread than oven No. 2. This is due to the larger amount of energy required for the preheating.

Consideration of the baking curves as a whole will emphasise the importance of the preheating characteristics in designing an efficient electric oven. For the kind of baking which requires a high temperature for a short time the preheating loss is considerably greater than the radiation and convection loss. Unless some method can be found for decreasing the energy used in heating the oven up from room temperature, it will not be practical greatly to increase the heat insulation

of the ovens used for domestic baking. This does not apply, however, to ovens which are used for long intervals at the

with the advent of electric ovens a revolution in the methods of cooking has become possible. Automatic electric ovens will probably be developed in which the temperature will be accurately controlled and the necessity of constant vigilance will be removed.

vigilance will be removed.

The present-day problem in electric cooking is to determine the methods of cooking that will yield the most in nutrition and flavour, and to formulate definite rules or directions so that a particular article of food can be cooked in the best possible manner by persons of ordinary skill. The engineer's problem is then to design practical cooking devices in which the temperature can be accurately regulated with a minimum of attention on the part of the housewife.

The increased popularity of the fireless cooker indicates that people are learning that food can be cooked at temperatures lower than the boiling point of water. The fact that several hours are required for the cooking is not a disadvantage when the process is automatic and does not require the atten-

when the process is automatic and does not require the attention of the housewife. Four hours would probably be the best time to cook the food. The housewife could put in the food for the mid-day meal immediately after breakfast while the oven was still hot. When it is taken out she could put in the oven was still hot. When it is taken out she could put in the evening meal, so that the oven would be used continuously. The preheating loss would thus be reduced to a minimum. During the latter part of the afternoon the housewife need not

During the latter part of the afternoon the housewife need not be tied to her kitchen, as all that would be necessary at this time would be to dish up the food and serve it.

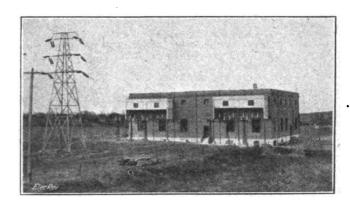

The electric light and power companies should be interested in perfecting this method of cooking and in bringing it to the attention of their customers. A combination of the electric oven and the popular fireless cooker would be a very desirable load for the central station. It would be a nearly steady all-day load and would not interfere with the peak load even in the winter, as sufficient heat can be stored in a well-insulated oven to keep the food hot enough to serve for an hour or more

oven to keep the food hot enough to serve for an hour or more after the current is turned off.

The results of the cooking experiments in electric ovens indicate that it is possible to reduce the art of cooking with electricity to an exact science. If definite rules of time and temperature were formulated for cooking each article of food, the inexperienced housewife could obtain uniformly good results with the expenditure of a minimum amount of attention and fuel tion and fuel.

#### THE REPORT OF THE ONTARIO HYDRO-ELECTRIC COMMISSION.

The seventh annual report of the Ontario Hydro-electric Commission, which covers the year's working to October 31st, 1914, fills a bulky volume, which, with its numerous illustrations and detailed statistics, one must suppose forms the most complete annual electric supply report in existence. The total capital expended to October 31st last on the Niagara, Severn, Wasdell's, St. Lawrence, Eugenia, Port Arthur and Renfrew systems, and on municipal construction, etc., amounted to \$10,130,048, of which some \$4,390,000 was expended during the year. The Commission is constantly

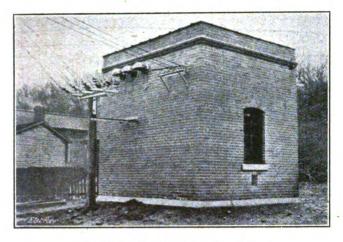

LARGE TRANSFORMER STATION. ONTABIO HYDRO-ELECTRIC SYSTEM.

adding to its consumers, and the accounts of 69 municipalities who are consumers have been consolidated in the present report, which shows that as at December 31st last, these also have made investments in distributing plants to the extent of \$15,249,203, carrying annual debt charges of \$661,949.

Including operating charges these municipal undertakings cost for the year \$2,674,703, and earned \$3,433,936, leaving a gross surplus of \$759,232, or deducting depreciation, a surplus of \$401,349. The accumulated surplus (3 years) invested in plant extensions, is \$1,601,167 (from 63 municipalities), and deducting \$850,618 for depreciation reserve, the surplus of \$750,549 is over 10 per cent. on the revenue of the three

The report says, "the result is of particular interest and value as it is the final answer of the municipalities to their experiment in the co-operative transmission and municipal distribution of hydro power." The total number of consumers

STANDARD DISTRIBUTING STATION.

was 96,744, of which 93,179 were lighting and the rest power consumers. The highest cost per kw.-hr. for domestic lighting was 10.9c. and for commercial lighting, 9.4c.; the respective average costs were 4.8c. and 3.9c.

The Niagara system is, of course, the principal one controlled by the Commission, having 609 miles out of the total of 800 miles of secondary transmission lines connected; the pressure of these lines varies from 46,000 to 2,200 volts. The yearly average H.P. of the Niagara system is over 50,000, while the connected power load is about 68,000 H.P. The total transformer and distribution station capacity of this system is 183,440 k.v.a. (including Niagara station, 80,500 k.v.a. and Toronto station, 25,000 k.v.a.), while for the whole of the Commission's systems, the capacity is apparently over 193,000 k.v.a.

During the year important extensions were carried out to the transmission system. A duplicate line from Niagara to Dundas, 50 miles, has been completed, using copper cable and tandem steel tower construction, with standard spans of 630 ft.

The first of the Commission's own power

using copper cable and tandem steel tower construction, with standard spans of 630 ft.

The first of the Commission's own power plants, at Wasdell's Falls, was brought into operation, this being a 1,200-H.P. hydroelectric plant.

The Eugenia Falls scheme which will develop 8,000 H.P., is now being carried out, the initial installation calling for two 2,250-H.P. turbines.

On account of the widening and deepening of the Welland Canal by the Dominion Government, it was necessary to lengthen the spans across the canal from 407 to 532 ft. To do this, one standard tower was removed from the transmission line, one anchor tower was moved 45 ft. and the two high towers supporting the canal one anchor tower was moved 45 ft. and the two high towers supporting the canal crossing span were moved, one 63 ft. and the other 62 ft. The important part of this work was the moving of the two latter towers; each weighed 25 tons and was supported on a heavy reinforced concrete base; the overall height was 168 ft. These towers were moved standing, being pulled along timber skidways to new concrete foundations. To maintain continuity in supply, two temporary crossing lines were built north and south of the crossing, far enough apart to allow of a vessel in between, and by this means a boat could pass through with very little delay and without having a complete shutdown of the power circuits.

As many distributing stations are required to meet similar demands, the Commission has prepared standard designs and

quired to meet similar dentands, the Commission has prepared standard designs and layouts, covering eight capacities, from 3-25 K.V.A. to 3-150 K.V.A. transformers.

Under the section devoted to "operation," the report states that the power furnished to the Commission by the Ontario Power Co. had been practically continuous during the year. The greatly reduced number of H.T. interruptions due to insulator trouble, indicates the efficiency of the arrangements now in use for eliminating defective insulators. defective insulators.

Thirty-three different electrical storms were reported over the system, and of these ten were severe and the rest moderate. They occurred between March 25th and October 10th, and seven of them traversed the whole system.

There were two total interruptions of service, due to light-ning and only momentary. The operating characteristics of the steel reinforced aluminium transmission cable used on recent work have proved very satisfactory, and confirmed the advantage over the straight aluminium cable, which was expected.

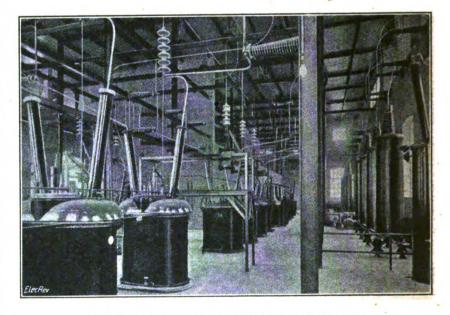

expected.

All the municipalities under the control of the Commission have now adopted a standard schedule of rates; for domestic service this year the "service" charge is 3 cents per month per 100 sq. ft. of floor area, with a minimum charge on 1,000 sq. ft in cities; 1,200 sq. ft in villages; or 1,500 sq. ft. in suburban districts, and a maximum service charge on 3,000 sq. ft. An additional consumption charge per unit is made, and a 10 per cent. discount is given for prompt payment. What is known as a "follow-up" rate (and has been used in this country with another name) is offered: all energy consumed over a certain amount being charged at half the recognized consumption rate. Commercial and street lighting rates are offered and power rates based on a charge of \$1 per month per H.P. of connected load or maximum demand and three consumption charges, varying according to locality, for the first and second 50 hours and subsequent use of the load.

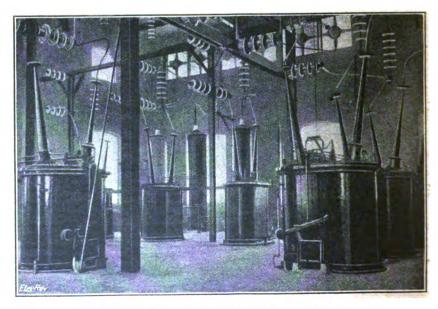

In addition power consumers are divided into four classes. i.e., 24 hrs. unrestricted users, and they receive discounts, amounting to 33½ per cent. in the latter case.

The Commission has a Purchasing Department whose services are affected to any municipality or institution in Ontario.

The Commission has a Purchasing Department whose services are offered to any municipality or institution in Ontario; about \$600,000 worth or material was purchased during 1914

H.T. ROOM, LONDON TRANSFORMER STATION, ONTABIO.

HT, ROOM, BRANT TRANSFORMER STATION, ONTARIO.

in this way, and savings of from 10 to 50 per cent, made in

transformers, meters, lamps, and wire.

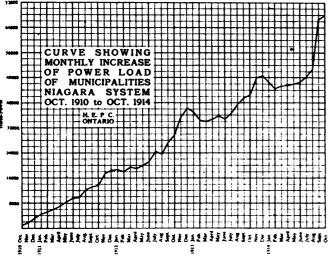

During the year an Electrical Inspection Department has been formed, and seventy municipalities have appointed

inspectors.
Farming Supply. inspectors.

Farming Supply.—Arrangements were made with a number of manufacturers for the erection of a model Barn and Dairy, which were electrically driven by a 5-g.p. and 1-H.P. motor, respectively, and used for demonstration purposes at the Canadian National Exhibition, 1914. Each manufacturer had a demonstrator with his apparatus, and the opportunity was taken to instruct farmers as to supply facilities.

The exhibit was electrically lighted by a system installed in conduit, and a "Syndicate" electric outfit for silo filling and threshing, consisting of a 20-H.P. motor installed in owagon, the necessary transformers, meters, and connections

wagon, the necessary transformers, meters, and connections

NIAGARA LOAD CURVE, ONTARIO HYDRO-ELECTRIC COMMISSION.

installed in another wagon, and one of the largest ensilage cutting boxes was also shown. Demonstrations of electric household and farming appliances were made at numerous fairs and exhibitions throughout the area.

The advantages of electric power over steam, gasoline, windmill, and sweep power are quite apparent to the farmer in most districts, but the question with him is how he can apply the power so as to receive full value for the money expended per year for service and power. To make proper comparison the value of the farmer's and his assistants time has to be taken into account; until recently the farmer would not concede that his time was worth "so much per hour." Electricity in rural sections is supplied for farm lighting, power and cooking, including power for threshing and silo-filling. Also to brick and tile yards, saw mills, cheese and butter factories, pumps, chopping and flour mills, beet sugar factories, quarries, street lighting, etc.

Electric lighting is greatly appreciated by the farmer as relieving the dull appearance of the farm, decreasing the fire risk, etc.; in barns it is found necessary to run the wire in conduit.

The cost of such installations in Canada varies for open

conduit.

The cost of such installations in Canada varies for open The cost of such installations in Canada varies for open wiring from \$1.25 to \$1.75 per outlet, and for concealed wiring from \$1.50 to \$2.25 per outlet. Surface conduit installations in farms and farm buildings vary from \$3.25 to \$4.50 per outlet; the figure does not include fixtures, but includes switches. An interesting series of tables are included relating to farm uses of electricity, of which we give some abstract data in tables I.-III.

The totals are given below table II.; the service charge is \$2.40 per month, and the current charge 4½c. per kw.-hour, with a 10 per cent discount on the latter only.

\$2.40 per month, and the current charge 4½c. per kw.-hour, with a 10 per cent. discount on the latter only.

[The revenue from the six farmers amounted to about £88-89 for domestic uses and one motor; the same revenue would be obtained in England with rates of 6d. per unit for lighting and 2d. per unit for power.]

Table III.—Total kw.-hours, 5,524; av. cost per kw.-hour, exclusive of syndicate motor, 2.54c., and for all uses, 2.65c.

Similar data relating to five farms is given, from which it appears that electrical milking machinery costs between .18c. and .26c. per cow per milking for farms with from 12 to 30 cows, and together with lighting and water heating (where used) gives the biggest individual revenue items. The average yearly consumption per farm for the five cases, for all purposes, was 4,700 kw.-hours, and the average revenue per farm \$134 (£27). \$134 (£27).

Municipal and Railway Work.—During the last two years 22 municipalities have consulted the Commission regarding their underground systems, and the question of street lighting has been considered at the same time. For ornamental street lighting the nitrogen-filled lamp has been used with advantage, and complete installations of these lamps have been made at Hamilton and Stratford. Resolutions have been received from 138 townships, 38 villages, 42 towns, 11 cities, etc., asking for reports and estimates on proposed electric

railways; preliminary surveys have been made of some 1,200 miles of line.

Sections of the report deal with the work of the Commission's testing and research laboratories, and with hydraulic investigation and the construction of recent hydro-electric additions to the Commission's plant.

As regards testing, the peculiar characteristics of the demands of rural consumers which now form a rapidly increasing percentage of the Commission's power load, have called for special types of metering apparatus, and experiments have been conducted on various metering principles to meet the requirements.

Prolonged tests under actual conditions have been carried out on six types of electric cooking ranges, twelve makes of electric toaster, and 14 makes of electric iron.

The subject of street illumination was investigated; a large

majority of towns use the series system of distribution, and 60—100-watt lamps equipped with radial wave reflectors.

In connection with the question of exterior illumination, extensive tests have been made on diffusing glassware, the results showing a consistent superiority of one make over

the other.

Some 760 lots of lamps (representing 400,000) were tested during the year.

Advance in Prices.—THE WALSALL ELECTRICAL Co., LTD., announce that they have withdrawn all outstanding quotations from June 14th, excepting those given in within the last 30 days, which will hold good for a period of 30 days. They are at present rearranging their catalogue prices, and will notify the trade of their new prices in the near future. In the meantime they will be pleased to quote against specification.

The Fixation of Atmospheric Nitrogen.-A great electrical undertaking which is intended to furnish energy in connection with the fixation of atmospheric nitrogen for the production of calcium cyanamide, from which nitric acid is to be obtained for the manufacture of explosiver, so as to render the country totally independent of external sources, in association with other works extracting nitric acid from synthetic ammonia, is now being taken in hand in Germany by the Berlin Electricity Works Co. The undertaking is primarily based upon the utilisation as fuel of the extensive lignite coalfields at Golpa-Jeanitz, near Bitterfeld, which were originally acquired by the Berlin company in expectation of a prolongation of its concession in Berlin and the intention to transmit power from Bitterfeld for distribution in Berlin. But before the Berlin Municipal Council recently resolved to take over electrical undertaking which is intended to furnish energy in contion of a prolongation of its concession in Berlin and the intention to transmit power from Bitterfeld for distribution in Berlin. But before the Berlin Municipal Council recently resolved to take over the undertaking of the Berlin electricity works next October, it had been decided on national grounds to devote the lignite fields in question, which cover a superficial area of over 2,500 acres, affording an adequate quantity of fuel for the projected station for a period of 30 years, to the realisation, indirect as it is, of the scheme for the fixation of nitrogen. The fields are owned by the Golpa-Jessnitz Co., which, in turn, is controlled by the Berlin company, which will possess the whole of the former capital on the receipt from the Berlin undertaking next October. As for the scheme itself, it appears that the Golpa-Jessnitz Co. has concluded a contract with the Bavarian Nitrogen Works Co. whereby the former has agreed to supply the latter with energy at a pressure of 80,000 volts for a period of fifteen years, the purchaser having the right to extend the contract for a further ten years on the same conditions, which are not disclosed, but which are reported to represent a price as low as 1 pfennig (125d.) per kw.-hour, owing to the exceptionally favourable conditions for working the lignite deposits. On its part the purchasing company has undertaken to accept delivery of 500,000,000 kw.-hours per annum. It is intended to erect for this purpose a generating station of 22,500 kw., of which four sets are said to be already under construction and are to be brought into operation by the end of the present year. The second batch of four machines is to serve for supplying undertakings similar to the Bavarian company, which are to be established near Bitterfeld, and the total output will supplying undertakings similar to the Bavarian company, which are to be established near Bitterfeld, and the total output will then reach 1,000,000,000 kw.-hours per annum. The electrothen reach 1,000,000,000 kw.-hours per annum. The electrochemical plant for the Bavarian company is also in course of construction, so as to be ready when the four sets of generating
machinery at Bitterfeld are brought into use. In this way the
Germans hope to be able to meet the entire home demand for
explosives and fertilizers in conjunction with the large extensions
of plant for the production of countries of provider and the production of countries of plant for the production of countries of countries of the production of countries of the production of countries of the production of countries of the production of countries of the production of countries of the production of countries of the production of countries of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of the production of plant for the production of synthetic ammonia which are in progress at the Baden Aniline works, and which are also to be completed by the beginning of 1916.

Aluminium Solder.—A new aluminium solder, known Aluminium Solder.—A new aluminium solder, known as the A B C, has lately been introduced by Proctor's Garage, Ltd., of Parliament Buildings, Orchard Street, Westminster, and Tontine Street, Folkestone. The solder is stated to be the result of a long series of experiments, its success being due not only to the ingredients used, but also to the special method of mixing, which ensures the quality being always reliable and free from variation. It is claimed that the solder can be used equally well for either the oxy-acetylene or ordinary tinsmith's process, previded the simple instructions given in a leaflet sent out by the company are followed. company are followed.

# THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872. TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4: LUDBATE HILL, LONDON, E.O.

Telegraphic Address: "AGREEAY, LONDON." Code, A B C. Telephone Nos.: Holborn 988; Central 4495 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades and har by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates. — Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

H. ALABASTER, GATEHOUSE & CO., 4, Ludgate Hill, London, E.C

#### THE I.M.E.A. MEETING.

ALTHOUGH the meeting of the Incorporated Municipal Electrical Association this year was held under exceptional conditions, and the business was limited to the reading and discussion of reports, the proceedings were by no means devoid of interest. The attendance was fairly good, all things considered, and the discussions were well maintained. One outstanding feature of the proceedings was the catholicity of the Association's activities, which was well exemplified in the range of subjects touched upon in the report of the Council. The meeting of the Association in the theatre of the Institution was not without a certain irony.

The joint report of Messrs. Blackman and Roles was in effect a eulogy of cheap units combined with the rateable-value system. It is clear that the Point Five tariff increases the consumption per house and the amount of consuming apparatus installed in a remarkable degree; the revenue per house is also materially improved, though, as would be expected, the average price obtained per unit is much less. Thus both the consumer and the contractor are "satisfied." The correction applied by Mr. Blackman to his figures, to allow for the effect of the introduction of the metal-filament lamp, is important in interpreting the results; it does not appear in Mr. Roles's tables, though his comparative figures for last year indicate that the 1910 results cannot safely be used without it. It is satisfactory to note, too, that the maximum load on the feeders has increased at a far less rate than the kilowatts installedgiving due weight to the footnote to Mr. Roles's table. To sum up the matter briefly, it appears that the rateable-value method of assessment applied with discretion affords a very practical means of arriving at the fixed charge, and is easily understood by the consumer; the running charge of a halfpenny per unit adequately covers the cost under the conditions obtaining; with few exceptions, no difficulty has been experienced due to the increased load on the mains; the use of one meter and a single wiring system is an immense advantage; and the adoption of electric heating and cooking has received a very marked stimulus wherever the tariff has been It was distinctly unfortunate that the discussion side-slipped on to the subject of the rateable-value system, which was merely incidental to the report.

Mr. Ayton's report on the use of the electric vehicle in

municipal service contained powerful arguments for the adoption of this type, and indicated that many municipal authorities had been so far impressed by its advantages as to place orders for "electrics." Most of the arguments, it is true, are more or less familiar, but they will bear much repetition—it is singular how difficult it is to persuade people to do themselves a good turn. The economy of the electric vehicle as compared with either horse haulage or petrol propulsion was clearly brought out—and this in spite of the heavy (some say excessive) first cost. It is interesting to note that satisfactory results are recorded, no matter what type or make of battery is used. battery and tires on maintenance contracts, there is little left to worry about, as the rest of the equipment is not likely to run up high maintenance charges, and the convenience, ease of handling, instant readiness and other advantages of the electric vehicle cannot be questioned. interest was shown in the collection of vehicles drawn up on the Embankment, representing a great variety of applications, and we trust that the outcome of the demonstration and report will be greatly increased interest and sympathy on the part of municipal engineers, and a greater readiness to provide charging facilities and a uniform price of 1d. per unit "off the peak." Without the charging facilities "electrics" cannot become popular; without the "electrics" the charging facilities are useless. This is a typical "vicious circle," and it rests with the station

Digitized by Google

engineers to break through it by doing their part first—the public will do the rest. The risk is small, and the prospect of reward abundant.

The report of the Council shows that in many directions progress is being made, but definite conclusions have not been attained. We note with regret that further negotiations with the Electrical Contractors' Association have failed to remove the deadlock between the two bodies, though the Scottish E.C.A. has accepted terms less advantageous than those offered in the I.M.E.A. Bill. There appears to have been a regrettable misunderstanding with regard to the Yorkshire Electric Power Co.'s Bill; had the I.M.E.A. been correctly informed as to the limits of the powers sought by the company, it would probably have refrained from active opposition to the Bill. It is interesting to note that in many respects the Association is in close co-operation with the B.E.A.M.A. At a joint meeting of representatives of the two bodies with the British Engineers' Association to consider the protection of British interests, it was decided to appoint a committee to prepare a scheme for the creation of a new Government Department, to be entitled the "Board of Industry," one of the main objects being to ensure that public money should be expended only on British manufactures—a principle with which we are in cordial agreement.

The Development Committee appointed last year has been hampered by the war, and appears at present to be marking time; progress has, however, been made with the organisation, and several sub-committees have been formed, the members of which are largely drawn from outside the Association. The Committee emphasises the necessity of additional powers, such as those embodied in the I.M.E.A. Bill, to enable municipalities to engage in publicity and

development work.

The progress made by the Electric Vehicle Committee has been recorded in our pages from time to time, particularly in connection with the urgent work of standardisation, and merits hearty commendation; we are glad to observe its unremitting activity, and the freedom with which it enters into collaboration with other societies.

Cordial co-operation between all branches of the electrical industry, and indeed between all sections of the nation, is the most pressing need of the hour; it is not a common feature of our national life, unfortunately, but this is no time for petty jealousies, academic scruples, and casual methods. Organised and collective effort is imperatively necessary to the maintenance of our prosperity; we must all pull together, and pull hard! And in this respect an excellent example is exhibited by the I.M.E.A. and its Committees.

A VERY fair degree of activity has been Rubber. passing in the crude rubber market within the last month or so, and although there have been moderate fluctuations in prices, the general tendency has been by no means unsatisfactory when all the circumstances are considered, and it is as clear as possible that consumption is proceeding upon a thoroughly satisfactory basis. There is no great supply of material available on the spot and for early delivery, while the demand is distinctly brisk, with No. 1 latex in the neighbourhood of 2s. 5d. per lb. There has also been a pronounced demand for forward deliveries, and a fair volume of business is reported at prices which must be regarded as exceedingly satisfactory to the growers. There is a disposition to take a strong view regarding the forward position owing to disturbances in the Near East, of which only vague and indefinite reports have reached this country. It is stated now that the trouble in Ceylon has been only a trifling affair, and this may possibly be true. It seems perfectly clear from the private news coming to hand that there is a good deal of unrest, not only in Ceylon but in the Federated Malay States. Various considerations, however, tend to stiffen the rubber market, where fortunately people are still alive to the common-sense point of view, recognising that any serious disturbance of the arrangements made for harvesting the rubber crop will have a very important bearing upon the military effectiveness of the Allies. The consumption of motor tires at the front is simply stupendous, and is bound to increase as more and more troops are put in the field, hence the production of tires and other accessories is limited so far as this country is concerned only by the amount of labour available. America is taking quite a considerable interest in the market, and has been doing a very fair amount of buying in the centres of production. It is estimated by leading trade authorities that the United States this year will import not less than 80,000 tons compared with 60,000 tons last year, 50,000 tons in 1913, and 40,000 tons in 1912. The quantities exported from this side to America this year show an enormous expansion, and the growth seems likely to continue. The way in which America is now showing a preference for plantation rubber over fine hard Para is a matter of general comment, and this preference seems likely to be carried still further.

The exports of plantation rubber from the Federated Malay States during May amounted to 2,708 tons as compared with 2,777 tons in April, and 2,069 tons in the corresponding month last year. The following table shows the exports month by month for the past three years:—

-	1918.	1914.	1915.	
January	1,231	2,542	3,473	tons.
February	1,757	2,364	3,411	17
March	1,737	2,418	3,418	**
April	1,626	2,151	2,777	17
May	1,225	2,049	2.708	11
Total (5 m	ontha) 8 476	11,544	15,787	"

THE case of Goodbody v. Poplar Borough Council, which is fully reported in the "Justice of the Peace" (June 5th, Explosions. page 218), establishes a principle which is of considerable interest to electrical undertakers. The defendants constructed under the pavement a brick chamber in which was placed a box containing fuses. Gas from mains in the neighbourhood leaked into the brick chamber and exploded, owing to the emission of a spark from a fuse in the box. The plaintiff, who was injured by the explosion, brought an action against the Council. A jury found that the defendants had not been guilty of negligence, and that the chamber was not a nuisance, and judgment was entered in their favour. On appeal by the plaintiff it was held that the defendants, not being responsible for the presence of the gas in the chamber, which alone made it a dangerous thing, were not liable. It follows from this that where a street box is properly constructed, the mere occur-rence of a short circuit is not a matter which gives a person injured by an explosion a right of action against the electric supply company. It would seem, however, that in such a case the plaintiff may successfully sue the gas company. We recall a case which was heard in the King's Bench Division before Mr. Justice Darling and a jury on March 16th, 1905. The action was brought to recover damages against a gas company for personal injuries caused to the plaintiff by the explosion of a telephone-wire box in Regent Street. There was practically no dispute that the explosion was caused by gas which had escaped from the company's mains and was ignited by a lamp. The question for the mains, and was ignited by a lamp. The question for the jury to decide was whether the accident arose by reason of any negligence on the part of the gas company. Practically the only evidence on this head was that the gas had escaped, and in spite of the fact that witnesses for the company said it was virtually impossible to prevent a certain amount of gas escaping from street mains, owing to the vibration caused by traffic, the jury held the gas company responsible and they were mulcted in damages. It should It should be mentioned that an attempt was made, in the Poplar case, to put responsibility for the damage on to the Borough Council on the ground that, in accordance with a wellknown principle of law, he who brings a dangerous thing such as electricity on to his land must keep it there at his peril. Mr. Justice Sankey, however, pointed out that here the mischief was done by the gas escaping from the gas company's property into the electrical authority's property, namely, the street box, and that there was no authority for the proposition that a man is under duty to keep a mischievous thing from other people's property off his own

### THE REGENT PALACE HOTEL.

THE Regent Palace Hotel, which has been erected by the Strand Hotel, Ltd., at a cost of £600,000, on an island site adjoining Piccadilly Circus, London, W., is said to be the largest hotel in Europe, being capable of accommodating some 1,500 resident visitors; it is truly palatial in character, and has been built and equipped on the most modern and advanced lines. The engineering installation is especially elaborate and well-designed, and embodies features of exceptional interest, being in some respects unique. Hot and cold water supply and electric heating are provided in every room; the ventilation scheme has been laid out with the utmost care, and electricity is freely employed for lighting and power, bells, &c.

The heating, ventilating, and general engineering plant was designed by Mr. A. H. Barker, and was installed under his supervision; the electrical equipment was carried out by the company's own staff, under the direction of their chief electrical engineer, Mr. Cushion. There are in all some 300 miles of pipes in the building, 15 miles of air ducts, 180 miles of electric cable, and upwards of 300,000 ft. of screwed conduit; the lighting installation includes some 6,000 Osram lamps. From these remarkable figures an idea of the magnitude of the undertaking may be gained.

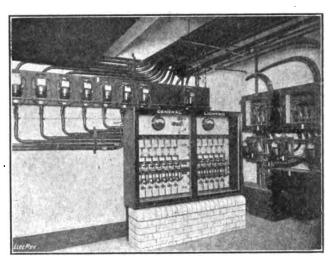

The heating of the building is effected mainly by hot water and steam radiators, three boilers being provided in the sub-basement for this purpose; electrically-driven centrifugal pumps are employed where necessary to assist the water circulation. There are 1,028 bedrooms, each of which can be warmed by a Belling radiator of  $1\frac{1}{2}$  Kw. Hot water is supplied to all bedrooms and to the hotel generally by three large calorifiers in the sub-basement; the temperature of the water is automatically controlled by electric valves, and the circulation is assisted by electrically-driven The ventilating system, which is entirely distinct from the heating installation, is exceptionally complete and elaborate. The principal reception rooms are supplied with fresh air, washed and cooled, or warmed if necessary, by two large centrifugal fans, driven by belts from electric motors; each principal room is also provided with an independent air-extracting fan, so that fresh air is forced in while vitiated air is simultaneously withdrawn, thus avoiding the production of draughts. Warmed or cooled air can be admitted to any room by separate ducts, so that adjoining rooms can be maintained at different temperatures if desired. Special care is taken to ventilate the huge kitchen through ducts entirely separate from the rest of the system, in order to render it impossible for the smell of cooking to penetrate any other part of the building. Warm air is supplied to the large linen room by a Sirocco fan driven by a 5-H.P. motor, and each bedroom, bathroom, &c., is separately ventilated by a duct running to the top of the building.

One of the most interesting novelties in connection with the heating and ventilating systems is the "control room," from which point the whole of the installation is controlled by one man. For this purpose, of course, electricity is the ideal agency to employ, and hence the control room is to be equipped with an array of electrical instruments (owing to the war it has not been possible as yet to complete the installation). By means of these instruments—many of installation). which are of Mr. Barker's own invention and design—the engineer-in-charge can ascertain the temperature at any one of about 250 points in the building; any five of these points can be simultaneously connected to a multiplex recording instrument, so that the changes of temperature can be recorded over any desired period. Other instruments measure the volume of air being supplied at any time to each of the reception rooms, and its temperature. Other indicating instruments show the water level in each of the 16 large water tanks, the boiler pressure, the temperature of the hot water supply, and even the proportion of CO, in the flue gases. Thus, the engineer has a bird's-eye view of the working of the whole installation; moreover, he is provided with controlling gear by means of which he can regulate all these factors without leaving the room. Most of the controlling devices are electrically operated, though a few are adjusted by levers, and the apparatus is so organised

that not only can the normal conditions be maintained in every part of the hotel, but also emergencies can be instantly met; for instance, a sudden influx of several hundred persons into one of the reception or dining rooms, previously unoccupied, demands an immediate readjustment of the heating and ventilating apparatus, and this can be effected at a moment's notice. The nice balance of air pressures in different rooms is an important point which is fully provided for; as an example, the air in the grill room, which immediately adjoins the kitchen, is always maintained at a slightly higher pressure than the air in the kitchen, so that when the communicating doors are opened there is an outward flow of air from the grill room, and under no circumstances can the kitchen atmosphere gain access to the grill room. The engineer-in-charge is in telephonic communication with every part of the building, and acts the part of a beneficent clerk of the weather towards all its occupants.

A pneumatic dispatch system, installed by the Lamson Pneumatic Tube Co., Ltd., provides a rapid service between various departments by means of independent lines, which do not, as usual, radiate from a central point. This installation comprises over 4,000 ft. of tubing, and is operated by a Roots blower driven by a 6-H.P. motor.

The electrical installation is necessarily of exceptional magnitude and completeness. The whole of the current is supplied at 220 volts by the St. James's and Pall Mall Electric Supply Co., Ltd. Two 08 sq. in. cables are run

Interior of one of the Switch rooms, showing Main Circuit-breaker, Meters, Disconnecting Links, &c.

directly and independently into the building from the Carnaby Street sub-station for the heating circuits, and the other main cables are proportionately large.

They are taken into two separate switchrooms through the company's main switch fuse and a circuit breaker. Three systems are provided: for general lighting, "police" or "Council" lighting, and for the general power service. Each has a capacity of 300 amperes, making a total capacity, apart from the special service to the electric heaters, of 1,800 amperes. The "police" service is a separate service required by the regulations in all public buildings of this kind.

The main service is taken into three main distribution boards, and from these are taken cables which serve each floor independently. Every floor is also separately metered and protected by enclosed cartridge fuses of G.E.C. make.

The distribution board controlling the heating circuits is in a separate chamber in the sub-basement; it comprises 60 separate D.P. fuses and switches, and is over 30 ft. long. From this board are taken 56 pairs of 19/16 cables to the various floors, and on each floor there are six sub-distribution boards. The sizes of the cables and feeders are designed to allow the whole of the heaters to be turned on at the same time.

The accompanying illustrations show the interior of the two switchrooms and the distribution board for the heating circuits. The arrangement of the switchgear is such that should the supply from either source break down, the whole of the circuits can be concentrated on the sound supply within a few seconds by withdrawing the links from the isolating switches on the faulty mains.

The whole of the wiring is carried out in screwed steel "Geekoduct" conduit, with brass unions, which are designed to secure lasting mechanical and electrical continuity throughout the system. Throughout the whole scheme a special water-tight junction-box has been used at frequent This, together with the conduit lay-out, permits of the withdrawal of any length of wire or cable without any disturbance of the permanent structure, the decorations of the building, or the plaster or cement in which the conduit is buried. The conduit work deserves especial praise, as we have never before seen a job so admirably carried out;

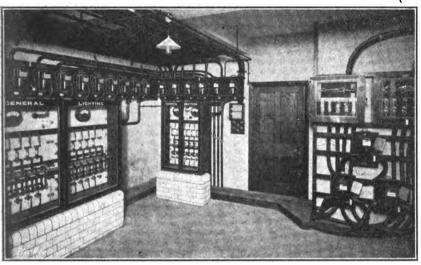

On the ground floor in connection with each lift is provided a mechanical indicator with arrows working on a semicircular dial, which will show the position of each lift in the shaft.

Up and down signal lights are fitted on intermediate floors, which indicate the direction in which the lift is

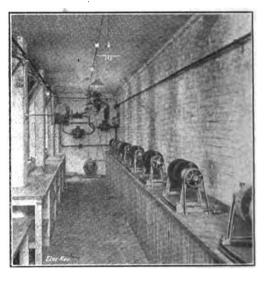

travelling.

This arrangement gives a most complete and convenient system for operating the lifts in groups, to make sure that a passenger requiring the use of the lift receives prompt attention, and at the same time it avoids two or three lifts going to the same floor to answer a call.

There is also an electric luggage lift carrying a load of

Interior of Switch-boom, showing Main Meters, Disconnecting Links, Council Switchboard, &c.

[Campbell-Gray. MOTOR DRIVING BUFFING MACHINES FOR BOOT-CLEANING.

the symmetry of the bends in heavy conduit, the neat and orderly arrangement of the tubing, even where dozens of pipes have to be accommodated in a confined space, and the finish imparted to every portion of the work, reflect the highest credit on Mr. Cushion and his staff.

It is apparent that no expense has been spared to make the installation in every respect of the first class, and worthy of the building in which it is installed.

There are five electric passenger lifts, each constructed to carry a load of 15 cwt. at a speed of 300 ft. per minute, the height of travel varying from 85 ft. to 122 ft.—one lift travels from the basement to the roof. The cages are of handsome design, and are fitted with Waygood-Otis safety apparatus, designed to arrest the descent of the cage in case of failure of the suspension ropes.

The winding machines are of the firm's latest pattern, with powerful motors coupled to machine-cut worm and wheel winding gear of high efficiency, and designed for

smooth running.

Each lift is controlled by a pilot switch in the cage operated by a removable handle which actuates the main controller; the latter is specially designed to secure smooth

and gradual starting and stopping.

In connection with the passenger lifts, a signalling arrangement is employed, of the newest pattern. In each cage is fitted a flash-light annunciator signal fixture. When a passenger wishes to call a lift he pushes the button on the enclosure, and this illuminates in each cage a miniature lamp representing that particular floor, and also operates a small buzzer to call the attention of the operator to the signal. The first cage arriving at the floor from which the signal is given will stop and pick up the passenger, and upon leaving the floor will automatically extinguish the signal lamp in all the cages.

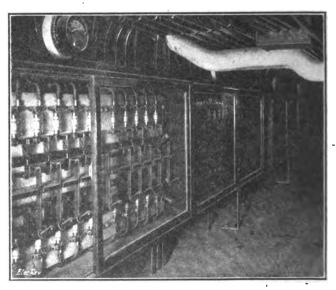

The signal is entirely automatic in its operation, and gives the operator no opportunity to extinguish it until he has reached or passed the floor from which the signal is given.

The indicator in each cage shows the operator the direction in which the passenger wishes to travel, as well as the floor on which he is standing. One call-push on each floor is arranged for two lifts, and one for the other three lifts, which are grouped together.

15 cwt. at a speed of 300 ft. per minute, and two electric goods lifts of the same duty which travel from the basement to the ninth floor. In all there are 32 lifts, including service and restaurant lifts.

Messrs. Waygood-Otis, Ltd., have also installed a complete hydraulic vacuum cleaning equipment. This plant, which feeds four points on each floor, is operated by an 8-H.P. motor.

In the kitchen equipment, there is a 4-H.P. motor driving a Hall refrigerator, an ice-making machine, an almond

MAIN SWITCHBOARD FOR HEATING CIRCUITS.

crusher, and a "whisk." The latter is provided with an ingenious form of friction drive, which enables the speed to be adjusted within very narrow limits. In the French Bakery there is a 2-H.P. motor-driven bacon-cutter and a mincing machine.

The refrigerating plant for the cold storage rooms is driven by an 18-H.P. motor, and is provided with a brine

h

ļŧ

2

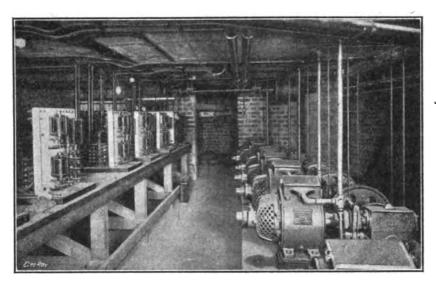

R

2

circulating pump driven by a 23-H.P. motor. There are also a large number of buffing machines for boot-cleaning, driven electrically, as shown on the opposite page.

For the lighting of the building some 6,000 Usram lamps have been installed, and the wiring has been laid out in two systems to comply with the L.C.C. regulations. Convenient control for all the bedroom lights is provided; in each room there are two lamps, either of which is controlled from a three-point switch at the bedside. A certain number of cross and corner corridor lights are supplied from the alternate one of the two systems into which the lighting supply is divided, so that the important lights in corridors are rendered independent of the circuit which supplies the bedrooms immediately adjoining those corridors. These special corridor lights are controlled by master switches at central points.

The general scheme of illumination is on the semi-direct system, and for this purpose a variety of designs of fittings by the Bromsgrove Guild have been installed. In the dome of the Rotunda Court the novel plan has been adopted of introducing opal bulls'-eyes into the risers which support

LIFT MOTORS AND CONTROLLERS.

the glazing of the dome. Behind each opal is a 30-watt lamp. Around the cornice of the dome is a ring of lamps, which are concealed from view at the floor level, but which throw a considerable volume of light upwards into the dome.

The scheme adopted for the electric bells has greatly simplified the bell signalling. Each floor is complete in itself and is divided into eight sections, each with a large By means of a four-point relay an indicator is also operated in the service room, showing which section has When the chambermaid goes to that been rung up. particular section she is shown by the section-indicator the number of the room calling. Thus the use of enormous lengths of multiple-wire cables has been avoided, without loss of efficiency.

We are indebted to the Strand Hotel, Ltd., to Mr. Barker, and to Mr. Cushion for the particulars and photographs embodied in this article, and we desire to offer our congratulations to all these parties on the accomplishment of an enormous undertaking on lines which can truly be said to be scientific, and in accordance with the most modern engineering practice.

Glasgow Exhibition.—We have received from Mr. Glasgow Exhibition.—We have received from Mr. J. M. Freer, of 38. Bath Street, Glasgow, a copy of the prospectus of the Glasgow Smoke Abatement Exhibition, which is being held under the patronage of the Corporation and the local branch of the Smoke Abatement League, at Exhibition Hall, New City Road, from Thursday, September 23rd, to Saturday, October 16th. Gas and electricity will be supplied free of charge to exhibitors. Class 7 will comprise "electric apparatus and electric heating and cooking appliances; Class 9, boiler furnaces, mechanical stokers, fuel economisers, &c.; Class 10, electric appliances and apparatus for the generation and utilisation of motive power; Class 11, suction gas plants, gas and other engines, &c.; Class 13, ventilating fans; and Class 15, shop window lighting." Particulars can be obtained on application to Mr. Freer, as above.

## BATTERY-BELL SIGNALLING SYSTEMS MINES.

HOME OFFICE REPORT ON THE DANGER OF IGNITION OF FIRE-DAMP-AIR MIXTURES.

## (Concluded from page 849.)

Dr. Wheeler points out that the single-bobbin bell (b) in the foregoing table is the more efficient, as this required a resistance of 230 ohms in circuit to prevent the bell ringing, while only 55 ohms had to be introduced to obtain the minimum igniting current. He further suggests winding the coils of the magnets with silk-covered annealed brass wire, instead of copper, as is usually used, and a bell arranged on these lines with a single bobbin wound with 11 layers of 25-gauge brass wire gave the following results, when operated with a battery of 10 Leclanché cells:—

Resistance of magnet, 13 ohms. Current, bell only in circuit, 0.62 ampere.

Resistance required to prevent bell ringing, 200 ohms.

Current with bell and resistance in circuit, 0.04 ampere.

The minimum igniting current, obtained from a battery of 10 dry cells,

was found to be 0.72 ampere.

This bell was tested under practical conditions at a colliery in Durham with a battery of 10 Leclanche cells, and "at 1,620 yards the bell rang very strongly. This was the end of the third section of the signal wires, and a connection had to be made to the third section. The wires in the latter had a great number of connections, mostly bad ones, which might have caused any bell to cease ringing. However, the bell rang quite distinctly, though not very loudly, at 1,910 yards, the end of the wires."
The italics are ours, and herein lies the crux of the whole question of efficient Dr. Wheeler's signalling in mines. Dr. Wheeler's experiments were carried out under perfect conditions, but below ground

the conditions are very far from being perfect, or, very frequently, in decent order. Electric signalling is so simple that anyone presumes to know all about it, and any sort of a connection will do, and frequently one will see a perfect network of wire connections without any order or system, whereas, arranged systematically, probably less than half would be required. Hence the demand for a bell that would ring under conditions which ought not to exist, and which required only a small current, necessitating the use of highly inductive magnet coils. Tests were made with eight bells of different makes with the following results :-

Bell.	Resistance of megnet,	Current (bell only in circuit.)	Resistance required to prevent bell ringing.	Current (bell and re- sistance in circuis)	Misimum igniting current.	Resistance required to reduce current to minimum ignit- ing current,
	ohms.	amp.	ohm«.	amp.	amp.	ohme.
A	12	0.63	175	0 07	0.19	50
В	13	0.28	80	0.13	0.13	80
C	30	0.38	75	0 12	0.13	75
D	12	0.63	225	0.02	0.30	45
B C D E	10	0.74	170	0.02	0.54	40
F	14	0.28	65	0.12	0 15	65
F G H	20	0.45	150	0.04	0.17	50
H	37	0 29	250	0.04	0 12	65

"Two points stand clearly out from an examination of this table. One is that all the bells tested are capable of giving a dangerous break-flash when used with a battery of 10 wet Leclanché cells (15 volts). The current available at the break-flash, supposing the signal-wires to be shortcircuited close to the bell so that only the resistance due to the magnet is included in the circuit, is in every case more than twice as great as the minimum igniting current, while in one instance (bell B) it is four times as great. The other point is that in the majority of cases sufficient non-inductive resistance could be introduced into the circuit to reduce the current available at the break-flash below the minimum igniting current without seriously affecting the ringing power of the bell. Bells D and H in particular allow ample margin for bad connections on the signal wires." For that very reason bells D and H would be looked upon as excellent bells.

Dr. Wheeler next tried "parallel" winding, in which one winding is used for ringing the bell, while the other is short-circuited on itself, with the following results:—
"Two bobbins were wound with 28-gauge copper wire in this manner and inserted in the bell frame. Tests were made using a battery of 10 wet Leclanché cells," with

(i.) Two bobbins, the additional winding being left open,

and the ends of the wire being free.

(ii.) Two bobbins, the additional winding being short-circuited.

(iii.) One bobbin, additional winding as in (i.).

(iv.) One bobbin, additional winding as in (ii.).

The main data obtained were as follows :-

	Resistance of magnet.	Current (bell only in circuit).	Resistance required to prevent bell ringing.	Current (bell and resistance in circuit),	Minicum igniting current.	Resistance required to reduce current to min mum 1goit-ing current.
(i) (ii.) (iii) (iv.)	ohms. 20 20 10 10	amp. 0'47 0'47 0'70 0'70	ohms, 100 115 75 95	smp. 0 10 0 09 0 14 0 12	amp. 030 * 0'48 †	ohms. 17 * 10 †

* Ignition at 1'55 amps., 38 volts, from 26 dry cells. † Ignition at 2'3 amps., 31 volts, from 21 dry cells.

It was found that whether one or two bobbins were used, the bell rang better with the additional winding short-circuited, and further, that more current was required for ignition by the break-flash when the additional winding was present but open than when the winding was absent altogether.

Layers of tinfoil between the iron core and between the layers of copper winding were also tried; one bobbin was wound with 16 layers of 28-gauge copper wire in this manner, with a tinfoil strip between each layer, and tested with a battery of 10 Leclanché cells, with the following

results:—

Resistance of magnet, 12 ohms.

Current, bell only in circuit, 0.78 ampere.

Resistance required to prevent bell ringing, 115 ohms. Current, bell and resistance in circuit, 0·10 ampere.

The minimum igniting current for the break-flash was found to be 2.30 amperes (at 27.5 volts) obtained from 19 dry cells.

Several other methods of preventing sparking were tried with more or less effect, but not so simple of application as those described. The conclusions reached were briefly as follows:—

1. All the bells examined were capable of producing a highly dangerous break-flash at the signal-wires when used with a battery of 10 wet Leclanche cells, the current voltage being 15. The break-flash was still more dangerous when a battery of 10 dry cells was employed, since the current available from them is considerably greater than that obtainable from wet Leclanche cells.

In general the bells examined were "overpowered." A single bobbin with a reduced number of layers of wire was found in several cases, when fitted to the original bell-frame, to actuate the bell as efficiently as is required in practice. The use of only one bobbin (i.e., a bar electromagnet) with a small number of layers of winding reduces the self-induction of the circuit, and thereby decreases the danger of the break-flash at the signal wires.

2. Inasmuch as the voltage is relatively of little importance compared with the current strength so far as the safety

of the break-flash on the signal wires is concerned, it is desirable that attention should be directed towards not exceeding a certain maximum number of cells in the battery, rather than that care should be taken not to exceed a certain voltage. Moreover, it is desirable that a cell of comparatively high internal resistance, such as the wet Leclanché cell, should be employed, so as to avoid the possibility of obtaining large currents on short-circuiting the battery.

3. Taking as a standard battery 10 wet Leclanche cells, quart size . . . . giving a voltage of 15 and a maximum current on short-circuiting of about 1.5 amperes, it is possible so to modify the usual pattern of bell as to render the break-flash at the signal wires safe in the most sensitive methane-air mixture, without impairing the ringing power of the bell. This can be done in several ways, of which

the simplest probably are :-

(i) By the introduction of a non-inductively wound resistance coil in series with the magnet-coils, such that it will reduce the current available at the break-flash below the minimum igniting current.

(ii) By increasing the resistance of the magnet windings of the bell by the use of wire of fairly high resistance, such as brass wire, for the same purpose as (i).

(iii) By the use of "parallel" winding, and

(iv) By the use of tinfoil strips between the layers of winding, in the manner and for the purpose already described.

Of these four methods the third may be open to the objection that should the short-circuited winding be acci-

dentally broken, the bell might become unsafe.

No experiments were made as to the igniting power of the maintained spark at the trembler of the bell, for it was apparent from the bells examined that the provision of an adequate flame-tight casing, affording complete security against ignition of a firedamp-air mixture at the trembler of the bell, was not a difficult matter. Nor were any experiments made with relays such as are often introduced in battery-bell signalling systems, for, in Dr. Wheeler's view, a relay, if introduced into the signalling system, simply takes the place of the bell, and, from the point of view of danger at the break-flash on the signal wires, can be regarded as a bell. This, of course, is an entirely mistaken impression.

impression.

The report is interesting and settles once for all a much debated point. It was, of course, never seriously questioned that an electric spark would ignite firedamp, but the extremely weak currents of the signalling systems were considered harmless. As a matter of fact, Dr. Wheeler's report confirms this impression to some extent, but the self-induction of the magnet coils, which is the true source of danger, was never really considered. It ought not to be a difficult matter for colliery managers to arrange their signalling systems now so as to be absolutely safe, and with

a little care and attention to maintain them so.

We are glad to note that I)r. Wheeler is to continue his investigations into the relay and alternating-current systems

of signalling.

# A LOCOMOTIVE COACH FITTED WITH THE THOMAS TRANSMISSION.

On Thursday last week we were enabled, by the courtesy of The Thomas Transmission, Ltd., to witness a demonstration at Birmingham of a 200-H.P. locomotive coach which has been fitted with their system, for use on the New Zealand Government Railways.

Our readers are already familiar with the principle of this extremely ingenious system of transmission, as fitted to heavy lorries, &c, which was first described in our issues of May 5th and June 23rd, 1911, and has been referred to from time to time in our pages. In a paper read before the British Association in Australia last year by Mr. H. J. Thomson, and abstracted in our issue of October 30th, 1914, the application of the system to heavy internal-combustion locomotives was discussed, and the recent demonstration marks a further step in this direction.

In view of the vast stretches of arid desert across which railways are now being constructed in Australia, the importance of the subject to the Commonwealth is obvious, steam locomotives being handicapped for supplies of coal and water; but even where there is no lack of these, it is claimed that the oil-engine driven locomotive equipped with the Thomas transmission has many points in its favour.

It will be remembered that, in the briefest outline, the

It will be remembered that, in the briefest outline, the Thomas system employs two electrical machines (each about one-third of the power of the engine) and a planetary gearing which connects these machines with the engine and the load. During starting and acceleration the power is transmitted partly mechanically and partly electrically to the

trailers, each having about the same seating capacity. It is expected that the output will be about 200 ton-miles per gallon of petrol. The vehicle will have to be able to haul one 25-ton trailer up a grade of 1 in 40 at 15 M.P.H., the gross load being about 60 tons; the maximum speed on the level will be over 40 M.P.H., and it is estimated that the vehicle will haul a gross load of 85 tons up a grade of 1 in 40 at about 10 M.P.H. By itself the coach will ascend this grade at 28 M.P.H. It is 62 ft. 6 in. in length overall.

this grade at 28 M.P.H. It is 62 ft. 6 in. in length overall.

As shown, the engine is of the V type and has eight cylinders, 7 in. bore × 8 in. stroke; the normal speed is 900 R.P.M., and the maximum 1,500 R.P.M. Opposite cylinders act on the same crank, thus shortening the engine

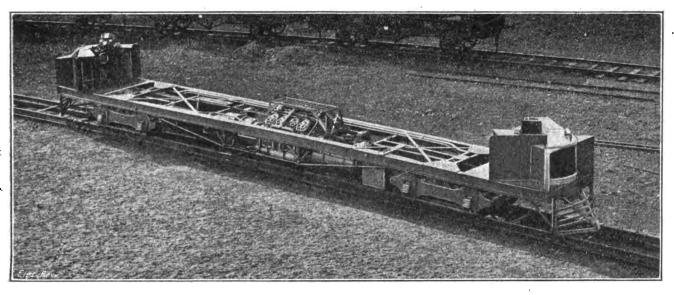

FIG. 1.-LOCOMOTIVE CHASSIS FITTED WITH THE THOMAS TRANSMISSION SYSTEM.

wheels, but when full speed is reached the whole of the power is transmitted directly from the engine to the wheels. In the case of the locomotive here referred to, certain modifications have been introduced into the design, without affecting its main principles.

The locomotive chassis has been built by The Thomas Transmission, Ltd., for suburban traffic, where the smoke and noise of a steam locomotive would be objectionable, and All the valves are external to the V, so as to be readily accessible. The engine is reversible, and is extremely compact; the circulating water is cooled by radiators at either end of the locomotive, both of which are effective irrespective of the direction of motion, and separate radiators are provided for cooling the lubricating oil for the engine and the planetary gearing respectively, the oil and water being circulated by pumps driven by the engine. Although the

engine is reversible, only the crankshaft reverses its direction of rotation, the pumps, magnetos and cam-shafts always running in the same direction.

The planetary gear wheels are double helical, and are provided with forced lubrication, running silently and with high efficiency. The two electrical machines, which are alternately motors and generators, are totally enclosed and weigh only 15 cwt. each; they are arranged on a plan differing from that adopted for motor lorries, one machine forming a complete unit with the planetary gearing and two magnetic clutches, as shown in fig. 4, while the other is mounted independently of the prime mover and transmission unit.

The former unit is rigid in construction, ensuring perfect alignment, and transmits the mechanical drive to the outside axle of one bogie; the latter unit drives the outside axle of the second bogie purely electrically. Tubular cardan shafts are used for both drives, with universal joints which ensure perfectly uniform angular velocity of the

driven wheels. The final drive is effected by means of bevel and spur-wheel reductions, as shown in fig. 5, which diagrammatically illustrates the arrangement of the transmission.

It will be noticed that in this form of the system the second machine is not directly coupled to the larger sun-wheel, as in the lorry previously described; it is, however, indirectly

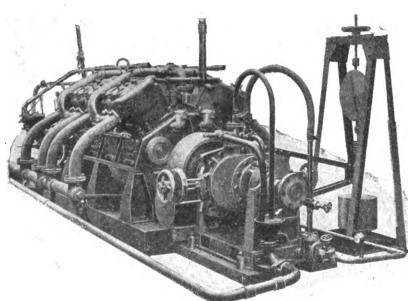

FIG. 2.—TYLOR 200-H.P. PETROL ENGINE ON BRAKE TEST.

has been fitted with a petrol engine by Messrs. J. Tylor and Sons, Ltd. Fig. 1 shows the complete chassis, and fig. 2 the Tylor engine, while a closer view of the controller and one of the bogies is given in fig. 3. The body will be made and fitted in the works of the New Zealand Government Railways at Wellington. The seating capacity of the coach will be about 50 passengers, and it will haul two 25-ton

coupled to it through the driving wheels and rails. Another difference lies in the use of magnetic clutches, which are exceedingly easy to control and are admirably adapted to deal with large powers. Moreover, reversal is effected by reversing the engine, and not by electrical means, as the locomotive must run with equal facility in either direction. The bogies are of novel construction, designed to eliminate rolling and to give easy riding of the vehicle.

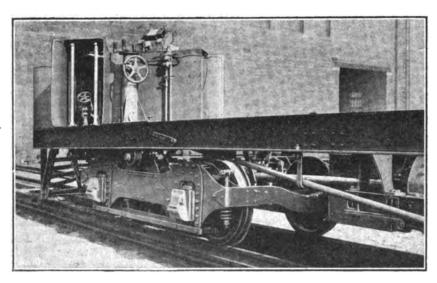

FIG. 3.-CONTROLLING GEAR AND BOGIE.

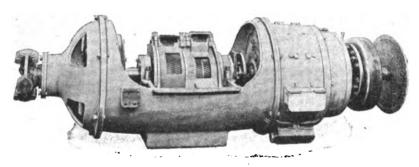

FIG. 4.—TRANSMISSION UNIT, WITH PLANETARY GRAR AND MAGNETIC CLUTCHES.

The control of the locomotive can be effected from either end of the vehicle. The main controller provides for 12 forward speeds, including direct drive on top. The reverse for continuous working is obtained by reversing the direction of rotation of the engine. Two reverse notches are provided in the controller for reversing for short distances when shunting, &c., the power being then transmitted purely

be seen from the diagram, fig. 5, that there are two magnetic clutches, first, the free-wheeling clutch, which is engaged for all running speeds, and, secondly, the top-speed clutch, which is engaged only for the direct drive, starting the engine, and emergency reverse. Both of these clutches can be disengaged by putting this auxiliary switch in the "off" position. It will thus be seen that if at any time the driver wishes to bring the vehicle to rest, it is not necessary to

move the main controller, the act of freeing the engine being effected by moving only the auxiliary switch lever.

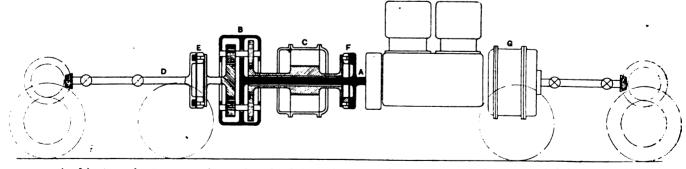

In order to start the locomotive, the control handle is moved into the "start engine" notch, which connects the battery across No. 1 machine; the auxiliary switch is then closed, thus coupling No. 1 machine by means of the top-speed clutch directly to the engine.

As soon as the engine has been started the auxiliary switch is put into the "off" position and the main controller moved into the first speed notch. By slowly bringing the auxiliary switch into the "on" position, the free-wheeling clutch is gradually engaged, causing machine No. 1 to be driven round in the reverse direction to the engine. As the vehicle gains speed the main controller is gradually moved to the top-speed position, when the direct drive is obtained by engagement of the top-speed clutch, which locks the epicyclic gearing together, and at the same time reduces the current generated to zero. The notch beyond top speed provides for charging the battery, which has a capacity of 200 A.H. at 40 volts.

The method of charging the battery with two series-wound machines is novel and ingenious. The connections are so arranged that one machine runs as a motor in series with the field of the generator, and as the speed of the motor armature (machine No. 2) is controlled by that of the locomotive, its counter E.M.F. is proportional to the speed of the coach; hence the current in the field magnet of the generator

varies inversely as the speed, and the result is a constant E.M.F. in the generator armature for charging the battery at all speeds.

Westinghouse brake equipment is provided, the compressor being directly coupled to the crankshaft of the engine. In addition hand brakes are provided for emergency use.

, engine drive to B, planetary gear casing; c. first electrical machine connected to small sun wheel; D, mechanical drive to first bogie; E, magnetic clutch for free-wheeling; F, magnetic clutch for direct drive on top speed; G, second electrical machine, driving second bogie.

FIG. 5.—DIAGRAMMATIC ABBANGEMENT OF THE TRANSMISSION SYSTEM.

electrically. This is effected by coupling up No. 1 machine directly to the engine and transmitting the power electrically therefrom to No. 2 machine, which is permanently coupled to one of the driving axles.

In addition to the main controller an auxiliary switch is provided, which is used to control the car in much the same way as the clutch pedal on an ordinary touring car. It will

The weight of the complete vehicle, exclusive of the body, is approximately 18 tons, of which the engine, transmission, and radiators weigh about 7 tons.

As previously recorded in our pages, The Thomas Transmission, Ltd., entered the railway field some years ago, and the excellent results obtained with their rail-car in South Africa led Mr. W. W. Hoy, general manager of the South

African Railways, to recommend it for use on the New Zealand Railways.

The advantages of the system have been pointed out in our pages, and the fact that it provides the flexible and efficient link between the engine and the wheels that is essential to the success of the internal-combustion engine on railways ought to be fully recognised.

The obvious point to which criticitism would naturally be directed is the gearing; but while in the past this might have constituted a weakness, with modern well-lubricated gear wheels that is no longer the case, and the fact that the R.A.C. awarded the company the Dewar Trophy in its 2,000-mile trials in 1911 testifies to the merits of the system. Where complete electrification would not be plaintiffs wanted to get up a winding up order. I must grant the

resent application.

Defendants' secretary added that there were no assets in England,

with the plaintiffs, as all the and that they could do nothing with the plaintiffs, as all the creditors must be treated in the same way. All the creditors would stand together.

JUDGE RENTOUL said the plaintiffs would have leave to issue

THE BURGH OF ALLOA v. ALLOA THEATRE Co., LTD.

A TEST case has been brought in Alloa Sheriff Court, before Sheriff-Substitue J. Dean Leslie at the instance of the Provost, Magistrates and Councillors of the Burgh of Alloa against the Alloa Theatre Co., Ltd., trading at The Pavilion, Alloa, for the payment of an account for the supply of electricity during the month of March.

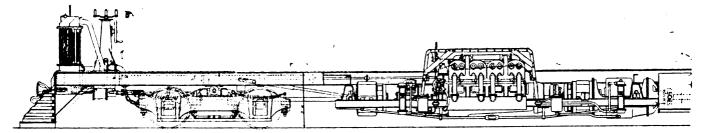

FIG. 6.—PART SIDE ELEVATION OF LOCOMOTIVE, WITH FRONT SOLE-BAB PARTLY REMOVED.

justified by the traffic conditions, the next best thing is to employ rail-cars of this type. It is, of course, not essential to use petrol; whether petrol, paraffin, or crude oil be used is a question which has nothing to do with the transmission system. A specially important feature is the high efficiency of the system at all but the lowest speeds; the speed on grades approaches the maximum possible with the engine

FIG. 7.-LOCOMOTIVE HAULING A LOAD OF 200 TONS.

power available, and during most of the running time the engine drives direct, so that the losses in the variable-speed gear are practically negligible.

The company are to be congratulated on the success their system has already attained; we commend it to the notice of all our readers who are interested in traction, for it is applicable to all kinds of self-contained locomotives, including vehicles propelled by storage batteries.

## LEGAL.

ELECTRICAL APPARATUS Co., LTD., r. CANADIAN BRITISH ENGINEERING Co., LTD.

In the City of London Court on June 17th, this case was mentioned. Plaintiffs, as already reported, had recovered judgment for £70 18s. 6d. against the defendant company, for electrical goods supplied in the way of trade.

Mr. Young, plaintiffs' solicitor, asked the Court to permit execution to be levied in accordance with the Courts Emergency Act. Defendants' secretary hoped the Court would not do that. A Committee of inspection of the defendant company had been appointed in Canada, and was working with the managing director, who was in Winnipeg.

who was in Winnipeg.

JUDGE RENTOUL wondered whether the assets of the defendant company would be less if he refused to allow execution to be

Defendants' secretary said they had a business in Winnipeg, but they could not realise their stock at present. They had £10,000 of stock there. If the Court granted the application it might make the defendant company go into liquidation. That would not be to the interests of the creditors.

JUDGE RENTOUL: The other creditors are not here, but the

The defence stated that the defenders had been charged at the rate of 4d, per unit, this being the rate charged for lighting purposes, whereas they contended that they were entitled to be charged for the current used in connection with the motor for the

charged for the current used in connection with the motor for the bioscope at the rates for motive power purposes, which, according to scale, were from 2d. to 1d. per unit.

MR. CHARLES THOMSON, Town Clerk, for the Corporation, said that Parliament had not laid down a rule that energy for lighting and power were to be charged at different rates. There was nothing in their Electric Order or in the Acts of Parliament that power and lighting were to be charged at different rates, nor had Parliament laid it down that these were to be charged at the same rates. The question was left quite oven to the undertaken so long rates. The question was left quite open to the undertakers so long as they gave no undue preference. In this case the defendants had been supplied with current from November, 1913. They had had been supplied with current from November, 1913. They had been charged at the prevailing lighting rate until now, when they disputed the account for which they were being sued. The motor in the Pavilion was used for driving a dynamo. The pressure of current supplied to the Pavilion was 440 volts. They could not pass 440-volt current through the lantern for the purpose of lighting a bioscope. The object of this motor was to drive the dynamo, and the dynamo converted the pressure of 440 volts into something like 60 volts. Therefore they had a motor-converter. It was not a motor for driving power at all.

The SHERIFF: If a man takes energy from you and is ingenious

The SHERIFF: If a man takes energy from you and is ingenious enough to get a motor in order to change it, are you to charge lighting rate? Are you not to supply him with power to do with

it what he pleases?

MB. THOMSON: No.

The SHEBIFF: You say that it is used for lighting, and, therefore,

must be at lighting rate?

must be at lighting rate?

MR. THOMSON said that that was so. If their centention was sound that they were entitled to be charged power rate because of the existence of the motor-generator or converter, what was to stop them from, in the same way, lighting up the premises? All this current was supplied by the undertakers for lighting purposes. The theatre company might do what they liked with it, but they must pay the lighting rate. The motor used by the defenders was used for lighting. Let them put aside how that light was brought about, but it was lighting. In the case of an ordinary motor it was used for mechanical power—a different thing altogether. The determining factor in a case of this kind was the ultimate use to which the current was to be put. He submitted that the ultimate use here was lighting. The Council made no distinction in price between the two theatre houses.

MR. JOHN REED, solicitor for the defence, said that there were

ME. JOHN REED, solicitor for the defence, said that there were in the defenders premises three meters, two of them for current at 220 volts, and the current passing through these two meters was for lighting the stage and the main building. There was a was for lighting the stage and the main bunding. There was supplied at 140 volts, and the whole of the current which went through that meter was used for defenders' purposes in driving this dynamo. So far as regarded the current supplied through the third meter, he claimed that it was current for motive purposes, and that he was entitled to get that at the rate at which the Town Council intimated these contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents of the council contents intimated they were prepared to supply customers for motive power purposes. He claimed to be supplied at the power rate intimated. They fixed a special rate for the Pavilion at 3d. per unit after 4,000 units, but he was not satisfied with it, and that was why he was there. There was no agreement between the Town Council and the theatre company.

was why he was there. There was no agreement between the lown Council and the theatre company.

The SHERIFF said it was a question of take it or leave it.

MR. REED replied: Exactly. His position was that this current supplied at 440 volts was supplied for motive purposes. It would entail a proof as to whether this was used for motive purposes or not. He could not see how his friend was going to say it

was not for motive power purposes, whether the ultimate effect of this dynamo was to produce a certain kind of light or not. That did not affect the question of driving the dynamo. The Sheriff said it was not light in the ordinary sense.

The Sheriff said it was not light in the ordinary sense.

Mr. Reed replied: It is not light in any sense.

The Sheriff: But there is light.

Mr. Reed said, supposing they had a gas engine driving the dynamo, they could produce the same light.

The Sheriff: But what is the light thrown upon the screen?

Mr. Reed: It is produced solely by the dynamo, which is the property of the defenders. That is light generated by the defenders. defenders.

The Shebiff: It is the pursuers' electricity altered in a certain

way?

MR. REED: Not at all. The pursuers' current is supplied to this motor which drives the dynamo, and from this dynamo we produce current of our own, which gives us a particular light.

The SHEBIFF: Could you use the energy that is supplied for lighting the hall for the bioscope?

MR. REED: It could be used, but it is not steady enough, and would simply give a flicker. The reason we have to make our own current is because the current supplied by the Corporation is not anitable. suitable.

The SHERIFF: So that you say the motor is for manufacturing

purposes?
MR. REED: Yes.
MR. THOMSON: What does it manufacture?

MR. REED: The light for throwing the pictures on the screen. MR. THOMSON: That is our contention, that you manufacture

light.

THE SHEBIFF: There are two questions. Whether the motor is being used for motive power. That is a question of fact. Then there is the question as to whether there is undue preference.

Unless you can adjust it, the question of the motor can be left to a life for a skilled man to decide.

ferce. It is for a skilled man to decide.

The Sheriff, after a few further observations, took the case to

avizandum.

#### Brown v. Lambeth Borough Council.

Brown v. Lambeth Borough Council.

At the Lambeth County Court, on Friday, Judge Parry gave a considered judgment in an action heard before him, in which a taxi-cab proprietor, of King's Cross, sought to recover damages from the Lambeth Borough Council for injuries to his cab. The action was reported in our issue of May 21st, page 720.

JUDGE PARRY said on January 6th, about 11 o'clock at night, the plaintiff was driving a taxi-cab when he came into collision with the refuge in the middle of the road, knocking down one of its cast-iron guards and damaging the pole of the arc lamp.

The PLAINTIFF said this occurred owing to the defendants' negligence in not lighting the refuge. The refuge was generally lighted by an arc lamp, which on this date, under police regulations, had been considerably darkened. At the moment of the accident the plaintiff said that the arc lamp was not alight. He was the only witness of this, but he (the Judge) saw no reason to disbelieve him. The arc lamp was lighted and controlled by an was the only witness of this, but he (the Judge) saw no reason to disbelieve him. The arc lamp was lighted and controlled by an electric lighting company acting for the defendants. The company's servants found the arc lamp alight at 5.30 on the afternoon of January 6th, and again at 11 o'clock on the morning of January 7th. Some evidence was given as to the type of lamp and the mechanism by which it was lighted and extinguished, but no effort was made to show that it was of inferior construction or in any way faulty. After the accident a police officer came up and noticed that the light was out, but his evidence was consistent with the defendants' contention that the collision itself extinguished the lamp. He believed the plaintiff's statement that the light was out at the time of the accident, but there was no evidence at all to show how it came to be extinguished or how long it at all to show how it came to be extinguished or how long it had been extinguished, nor was there evidence of negligence on behalf of the servants of the defendants or the electric lighting company in superintendence, management or control of the lamp.

The general lighting of the place was adequate and reasonable, having regard to the police requirements under the Order in Council for the Defence of the Realm. The fact that the arc lamp was not alight undoubtedly contributed to the accident, as lamp was not alight undoubtedly contributed to the accident, as did the speed at which the plaintiff was driving. So, too, did the general darkening of the surrounding lamps under the Order in Council. He found that the lamp was out at the time of the accident, that the lamp being out was not due to any negligence of the defendants or their servants, and there was no evidence to show how it came about that the lamp was temporarily extinuished. The action has were founded as action has a serviced as a guished. The action here was founded on negligence. There was no evidence of any negligence, and the defendants must succeed. He gave judgment for the defendants, with costs.

OSRAM LAMP WORKS, LTD, r. POPE'S ELECTRIC LAMP CO., LTD. On Tuesday, in the Chancery Division, Mr. Justice Joyce commenced the hearing of this action for an injunction to restrain defendants from infringing plaintiffs' letters patent, No. 23,899 of 1904, for damages and for the delivery up of articles or things made in infringement of the patent. The defendants denied infringement, and alleged that there was no subject matter for the plaintiffs' patent, and a want of novelty. Mr. Walter, having opened the case for the plaintiffs, evidence was heard and the case was adjourned. We shall report the matter in our next issue.

MR. LEVER, for plaintiff, gave notice of appeal.

#### CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communi-cations at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

#### Automatic-Lift Accidents.

I am gratified to find that the article I wrote you on the above I am gratified to find that the article I wrote you on the above subject has led to such an interesting correspondence. Mr. Butler gives instances of accidents which have come under his notice, and suggests the desirability of having a gate in the car. I quite agree with this, but the gate is useless unless provided with electrical contacts which prevent the lift being operated when anyone is standing in the car with the gate open. It should, however, be possible to call the empty car to any landing, assuming the landing gates to be closed, even although the last passenger omitted to close the car gate, as a person will rarely take the trouble on alighting from a lift to close two gates.

Referring to the question of arcing over in electric locks, I have myself experienced considerable trouble due to this. It is generally caused by one of the misuses I referred to, namely, stopping the

caused by one of the misuses I referred to, namely, stopping the lift by opening the gate whilst the car is passing. This breaks the pilot circuit in the lock, and as Messrs. Smith, Major and Stevens point out, a switch or contact which is constructed for making a circuit only is not well adapted for breaking it, the arcing distance being too short. The troubles which I have experienced from this cause have occurred principally on lifts on 400-volt circuits, and where the current carried by the pilot circuit was higher than should be necessary with properly designed solenoids. It is largely a question of distance between contacts and earthed metal; and wattage.

Mr. Rosenbusch and Messrs. Smith, Major & Stevens both complain that I have not done full justice to the most recent types.

of electromagnetic locks, and that the sketch I gave only illustrates

I made it quite clear in my article that the illustration was intended to illustrate only the general principle on which electro magnetic locks operate, and was not intended to show the detail of any actual lock. I am well aware that there are many excellent any actual lock. I am well aware that there are many excellent locks now on the market, as is mentioned by all the lift makers who have so kindly contributed to the discussion, and Mr. Scott showed details of the lock made by his firm (Messrs. The Medway Safety Lift Co.). It was very clear, however, from his excellent letter, that the best type of lock is not always fitted, as a purchaser who does not understand the technicalities of electric lifts cannot discriminate between safe and unsafe types of apparatus and, as a

rule, accepts the cheapest quotation.

It was suggested by some of the correspondents that the Home Office or the County Council ought to frame regulations covering electric lifts, and no doubt they will in due course do so. The HO., of course, exercise a general supervision over lifts in factories, for although they have no special rules bearing on the point, it is to some extent covered by the general rules relating to moving machinery and to electric installations. There are, however, a large number of lifts in buildings which do not come under the Electory Ac's and therefore do not come under the supervision the Factory Ac's, and, therefore, do not come under the supervision of the H.O. Inspectors: and, moreover, there are thousands of lifts outside the jurisdiction of the London County Council, so that it is obvious that if these two bodies drew up special regulations they would only cover a fraction of the lifts in actual use.

Frank Broadbent.

London, E.C., June 16th, 1915.

## Pitting of Brushes.

I should be obliged if any of your readers could indicate the

I should be obliged if any of your readers could indicate the cause of, and suggest a remedy for, the strange behaviour of the positive brushes of a 500-kw. motor-converter, compound-wound, and used for lighting and traction supply.

All the brushes are of hard carbon, 2 commutator bars in thickness, and there are six brush arms on the machine. All the positive brush surfaces are badly pitted in the middle, but at both leading and trailing sides of the pitted portion the surfaces are prfect. The brushes are well bedded, the arms properly spaced round the commutator, and the machine runs sparklessly at all loads. The negative brushes and the commutator are in excellent The negative brushes and the commutator are in excellent loads. The condition.

Thanking you and your readers in anticipation.

A. B. Johnstone.

Gateshead-on-Tyne, July 18th, 1915.

### Battery-Bell Signalling Systems in Mines.

It is somewhat surprising that Dr. Wheeler, in his experiments, has not tried the spark-extinguishing device (known to every telegraphist, and fitted to nearly all local telegraph instruments) of a non-inductive shunt of about five times the resistance of the magnet whose inductive effect it is required to get rid of. The shunt must be joined directly across the electromagnet (not across the bell terminals). A few feet—in some cases a few inches only—of 3-mil platinoid wire wound double on a bobbin is all that is required. The cost is negligible, and the result completely effective.

and the result completely effective.

The lower the resistance of the shunt the more effective it is in extinguishing the spark, but if made of a resistance approaching

Vol. 76. No. 1,961, June 25, 1915.]

that of the magnet it shunts, it would slow the action of the bell; if the shunt is made about five to ten times the resistance it bridges, then the slowing action is but slight, whilst its spark-extinguishing effect is most marked.

H. R. Kempe.

#### ELECTRICAL DEVICES. **FITTINGS** NEW AND PLANT.

#### Electric Lighting Sets.

Whilst there are now few towns of any size in this country that are not provided with a supply of electricity, there are innumerable small villages, hamlets, and isolated houses which have not yet enjoyed the convenience and economy of the electric light, and these afford a very wide field for enterprise. Many firms have taken steps to meet the needs of the larger country-house owners,

market with gratifying success. We recently had the pleasure of inspecting one of these interesting sets, which are admirably designed for the purpose outlined above. With the exception of the petrol engine, the whole of the apparatus is of British manufacture, and the greatest pains have been taken to make it in every respect as simple, robust, and reliable as possible. We illustrate herewith the outfit (No. 1 "D"), which contains "everything for a complete installation of 25 16-C.P. lamps down to the last screw," the intention being that the purchaser shall be in a position to erect the whole of it without having to buy anything in addition to the contents of the packing-cases, and without any outside assistance whatever—except, perhaps, the advice of the company's assistance whatever—except, perhaps, the advice of the company's

local agent.

For this reason the arrangement of the parts is carefully devised, For this reason the arrangement of the parts is carefully devised, so that the minimum of thought and work is required to place them in correct position and connect them up; the fittings and the switchboard are completely wired in advance, and all the terminals not already wired are labelled, so that the user has no difficulty in identifying those that are to be connected together. Full and lucid instructions are provided for erecting the plant and for running it. The switchboard carries only two single-pole switches and D.P. fuses, for the charge and discharge circuits respectively, a Record automatic switch, centre-zero ammeter, pilot lamp and shunt regulator. The battery consists of 26 cells of the

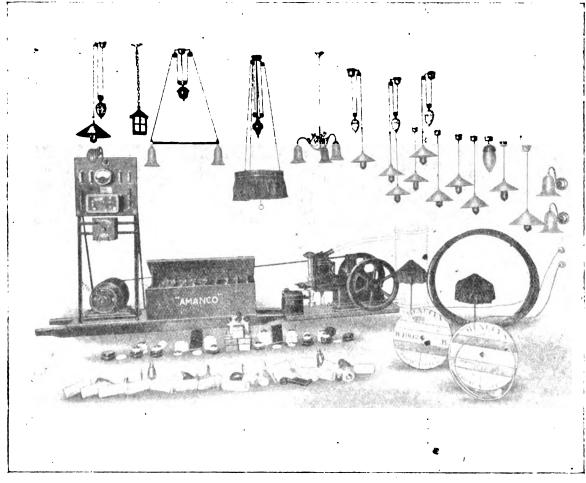

Fig. 1.—"Amanco" 25-Light Farm-house Lighting Set.

who can afford to install comparatively expensive plant, but until recently the case of the well-to-do farmer had received little, if any, attention. While this gentleman may not feel himself justified in expending a considerable sum on an electric lighting installation, he is quick to appreciate the advantages of electricity as compared with the oil lamps which he is usually compelled to put up with, and he is a handy man with tools; moreover, he often possesses one or more oil engines to drive himachines, and is accustomed to their management. These facts have been fully realised by the Associated Manufacturers' Co., of 72-80, Mansell Street, E., who for many years past have supplied enormous numbers of their handy oil engines to British farmers, and are thoroughly acquainted with the capabilities and mental attitude of their customers. The problem, however, was a difficult one to tackle, as it necessarily involved the use of a dynamo and a storage battery, the latter especially being a class of apparatus that one would hesitate to place in the hands of a wholly unskilled user. The cost of the whole installation also had to be kept down to the absolute minimum, and this called for the rigid standardisation of the whole outfit.

But the idea of a farmer's installation was to good to be disthe rigid standardisation of the whole outfit.

But the idea of a farmer's installation was too good to be discarded without an effort to carry it out, and the company designed a sample set, which was shown at an Exhibition in September last year; the inquiries which resulted indicated that the attempt was on the right lines, and, after further experiments, a complete "Amanco" electric lighting plant was placed on the

Naylor Battery Co.'s make, these having been selected on account of their ability to withstand rough treament and unskilled attention, and no attempt is made to regulate the battery voltage; the use of end-oell switches would inevitably lead to trouble, and would destroy the essential element of simplicity, while the voltage variation is of little consequence in comparison with the fluctuations experienced with oil lamps. The battery is not charged whilst the lamps are in use. It is of sufficient capacity to run two-thirds of the lamps for eight hours, and full instructions are given for its charging and maintenance: the capacity to the two-thrus of the tamps for eight hours, and full instructions are given for its charging and maintenance; the plates are contained in celluloid boxes.

The Amanco set is made in sizes for 25, 50 and 100 lamps of 16 C.P. each, and is arranged in four standard ways—for driving by an existing engine, which is possible in many cases, or by its own engine, and with or without the wiring and fittings, as in some cases the purchaser may prefer to have the installation carried out by a contractor. The illustration shows the complete 25-light set. by a contractor. The illustration shows the complete 25-light set. The only variation from the standard set is in the design of the fittings, of which different patterns are available. Not the least interesting feature of the system is the series of attractively designed folders, with the aid of which its advantages are effectively brought to the notice of prospective purchasers, and the drawbacks and dangers of oil lamps and lanterns are emphasised. We congratulate the company not only on developing a good idea, but also on the efficient and capable manner in which it has been carried into effect. into effect.

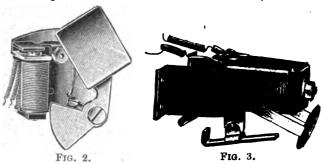

#### "Switch-off" Labels.

MESSES. HEBBERT TERRY & SONS, LTD., of Redditch, have sent us a sample of a patented metal label for attaching to ordinary tumbler switches, to remind the user to switch off the light. It consists of a metal ring with a projecting piece bearing the legend: "Please switch off when not required"; the ring fits on the porcelain base, being held in position by the switch cover.

These labels are printed in colours and quite reasonable in price.

#### Indicator Movements.

In their new catalogue of electric bells, accessories, &c., the GENERAL ELECTRIC Co., LTD., of 67, Queen Victoria Street, E.C., show a great variety of patterns of signalling devices. We illustrate in figs. 2 and 3 two new indicator movements; the first is

G.E. CO. INDICATOR MOVEMENTS.

for mechanical replacement, and is provided with double bobbins mounted on a brass base, to which all carrying pillars are bolted, no part being riveted except the flag. Fig. 3 shows a lift indicator movement which is self-locking, and is not affected by vibration.

#### WAR ITEMS.

Employment of Disabled Sailors and Soldiers.—The Coun-Employment of Disabled Sallors and Soldiers.—The Council of the Institution of Electrical Engineers desire to call attention to the demand for employment from disabled sailors and soldiers. The number at present requiring employment is not very large, but it may increase considerably during the next few months.

Enemy Trading in China.—Reuter's correspondent at Shanghai states that there has been a renewed agitation for the prohibition of enemy trading in China, in consequence of the discovery that the Germans are selling English-made goods.

usence of the discovery was all lish-made goods.

Wage Disputes in Australia.—Reuter's agent at Melbourne states that engineers there are demanding an increase of wages and have intimated their refusal to work with non-unionists. The dispute threatens to interfere with the

Australia and British Manufactures.—The council of the New South Wales Chamber of Manufactures has unanimously endorsed the following resolutions, which were agreed to at the meeting of the executive of the Associated Chambers of Australia, held recently at Melbourne:—

pers of Australia, held recently at Melbourne:—

"That the British Trade Commissioner be approached and requested to communicate with the British Board of Trade, urging upon it the necessity of encouraging the formation of a central body of manufacturers incorporating associations truly representative of industrial production as distinguished from commerce, with the view of enabling oversea buyers to discriminate between bona-fide British manufacturers and merchants and factors distributing foreign as well as British goods.

"The executive of the Associated Chambers of Manufactures of Australia further suggests that such an association, when formed, should link up with manufacturing associations and chambers of manufactures throughout the Den mions."—Sydney Morning Herald.

Petrograd Electricity Works.—With reference to the discussion which has been proceeding in Russia for some months past, Reuter reports from Petrograd that the Council of Ministers has decided that the Petrograd Electric Light Co., founded in 1886, is worked with German capital, and that the management of the company shall be taken over by the Russian Government. A similar decision has been taken with regard to the Electro-Peredatcha Company, of Moscow.

Air Raids and Street Lighting.—A communication has been addressed to local authorities in London by the Commissioner of Police of the Metropolis with reference to the missioner of Police of the Metropolis with reference to the question of the extinction of street lights in the event of a raid by enemy aircraft. Manifestations of popular opinion have occurred in favour of the total extinction of the street lighting when warning is received of an impending attack by hostile aircraft. In the early stages of the war the matter was very carefully considered by the Admiralty who are the Authority responsible for the protection of London against aerial attack, and their decision, which has been confirmed after further consideration, was that such a course was most undesirable. The Commissioner points out that the extinguishing of street lights would be fraught with the most serious consequences, and would possibly bring about many more casualties than would be caused by the enemy aircraft; that in the event of fires breaking out, the Fire

Brigade would not be able to reach their destinations; that Brigade would not be able to reach their destinations; that the traffic actually in the streets would be dangerously impeded; that ambulance and Police movements would be hindered; and that all the elements of panic would be introduced. The Commissioner also states that, as perhaps is not generally known, numerous observations from the air have been made from time to time by the Admiralty, who are satisfied that the present system of reduced lighting is the more satisfactory condition, since an observer from the sky is quite unable to determine the quarter of London he is passing over. According to expert opinion, the extinction of street lighting would rather aggravate than reduce the degree of danger to which the public are exposed.

Mechanics Called Back.—Questions were asked in the

the degree of danger to which the public are exposed.

Mechanics Called Back.—Questions were asked in the House of Commons last week regarding the application that had been received by the War Office and the Minister of Munitions' Department for the discharge from the Army of skilled mechanics who had enlisted but whose services were required by employers engaged upon War Office work. Mr. Lloyd George said that a scheme for dealing systematically with the matter was being arranged under which the Secretary for War would utilize the services of such men who were available in this country, by getting them back from the ranks to the workshops. The delay and inconvenience referred to by members of the House was largely due to the difficulty in finding the men. Continuing (according to the "Times" report), Mr. Lloyd George said:—"Steps have been taken through the Adjutant-General to find out skilled men who have joined the ranks. It was almost impossible to get at them. A good many men gave their names and were found not to be engineers at all. Now we have proceeded the other way. We have circularized all the engineering firms to get the names of the men they want back. These names are now coming in every day. We have already thousands coming in; we are going to classify these names and take steps on that basis to get the actual men whose assistance the firms want."

From the Front.—One of our correspondents with the Economic allegter from Suaz dated lune and then they want back.

names and take steps on that basis to get the actual men whose assistance the firms want."

From the Front.—One of our correspondents with the Forces in a letter from Suez dated June 2nd, thanks us for some copies of the "Electrical Review" which "came as an oasis in the desert." He adds: "Never was the 'E.R.' more welcome than here. It makes a distinct break from the routine of army life and outpost duty to be able to absorb 'ozone' from an electrical source." After giving a graphic account on the landing at the Dardanelles, as witnessed by the writer from a vessel anchored off the peninsular of Gallipoli, and the shelling of the trenches by the "Queen Lizzie," he expresses a longing, as some adequate means of retaliation against the enemy, for "an electric chair with a good plant behind it. It would be such a fine thing to be able to cure nervous disorders in our enemies by electrical treatment, all free of charge." In some observations on electrical work in the neighbourhood of Suez, the writer says that in wandering round "you find things which would give an English fire office inspector fits. For shop lighting flex on insulators wanders round indiscriminately; where a showcase is in the way, well, the flex goes-through it—any old way as long as the light gets there. The native mind says cheapness at any cost and damn the consequences." "Overhead systems seem to be the order of the day, and a hole punched through the wall is sufficient for lead in wires. In a great many cases the houses seem to be held together by the electrical attachments." "Again thanking you for the connecting link between the electrical world and desert existence, I will cease fire."

Steel Production in Germany.—In reply to a question in Parliament. Mr. Runciman (according to the "Times")

Steel Production in Germany.—In reply to a question in Parliament, Mr. Runciman (according to the "Times") said that the quantities of steel produced in the German Empire (including Luxemburg) in the first four months of this year had been reported as follows:—

Metric tons. 962,736 1915 January February 946,015 ... • • • ... ... ... March 1.098,273 April 1,012,334

Harrogate Electricity Staff and War Munitions.—The Electricity Committee of the Harrogate Corporation have delegated to the chairman and the borough electrical engineer (Mr. G. Wilkinson) the matter of dealing with the applica-tion of the engineer for the use of the workshop and the machinery therein for the purposes of making munitions of war. The employes have offered to work overtime on the production of war munitions if the application is sanctioned.

Personal.—Mr. James Hall, in charge of the electricity works at Polquhairn Colliery, Ayr, has joined the Royal

Navy.
Mr. Williams, traffic superintendent of the Bury (Lancs.) Corporation Tramways, has offered his services to the Military Motor Transport Department.

Military Motor Transport Department.

Mr. John Ward, of Brierley Hill, manager for the Dudley and Stourbridge District transways, has enlisted as a private in the Royal Army Medical Corps.

The Bury Transways Committee has authorised Mr. W. Clough (manager) to act on the local munitions committee.

Mr. S. J. Watson, the borough electrical engineer, has also joined the committee.

The American "Electrical Review" states that Dr. G. Klingenberg, director of the Allgemeine Elektricitäts Gesell-

schaft, Berlin, has been decorated with the Order of the Iron Cross for services in the field.

The "London Gazette" contains the following announce-

ments:-

Regular Forces.—Attached to Headquarter Units. Chief engineer—Lieutenant-Colonel Alain C. de L. Joly de Lotbinière, C.S.I., C.I.E., Royal Engineers, and to be temporary Brigadier-General whilst so employed. Dated 12th

porary Brigadier-General whilst so employed. Dated 12th December, 1914.

Tyne Electrical Engineers.—Corporals C. A. C. Aitkins and R. H. Rooksby have been promoted to be Second-Lieutenants. Dated June 23rd.

The City of Dundee Fortress Engineers (1st Company), under the command of Captain H. Richardson, city electrical engineer, Dundee, had an enthusiastic send-off on Tuesday afternoon, when they left for France. Headed by the Royal Scots Band, they marched from headquarters to the station, the route all the way being densely packed by spectators. At the station the departure was witnessed by a large crowd, including the Headquarters Staff, Captain Richardson's brother officials of the city, the Lord Provost and Town Councillors, and the chief members of the staff of Richardson's brother officials of the city, the Lord Frovost and Town Councillors, and the chief members of the staff of the Electricity Works. Amid general expressions of good luck and a happy return, the train steamed out of the station to the accompaniment of rousing cheers. We presume to the accompaniment of rousing cheers. We presume, from the fact that at the I.M.E.A. Convention Captain Richardson was referred to as Major, that he holds that tem-

Roll of Honour.-Private Harold Burrows, 8th Battalion

Roll of Honour.—Private Harold Burrows, 8th Battalion Manchester Regiment, who was with Messrs. Mirrlees, Bickerton & Day, Bramhall Moor, Stockport, has been killed in action in the Dardanelles.

Private A. G. Bell, of the 1st Northamptonshire Regiment, who has been killed in action at Aubers Ridge, was engaged in the Kettering electricity department prior to enlisting.

Private Fred Ellison, 8th Lancashire Fusiliers, who, prior to the war, was a clerk at the Westinghouse Works, Trafford Park, has been killed in action at the Dardanelles. He was 18 years of age. was 18 years of age.

was 18 years of age.

We also learn that Mr. Ralph P. Hulton, A.M.I.E.E., who was formerly north country representative of Holophane, Ltd., has succumbed to wounds received in the operations at the Dardanelles. Immediately upon the outbreak of war, Mr. Hulton enlisted in the Engineer Section of the Royal Naval Division.

Private Edward Gilbert, formerly an engineer at the Eccles Corporation electricity works, and son of the foreman engineer at the works, has been wounded while fighting in Flanders.

in Flanders.

George Guscott, employed at the Exeter Electricity Works, and who was called up as a Naval Reservist at the outbreak of war, is reported missing through the sinking of H.M.S. "Triumph" on May 25th.

## BUSINESS NOTES.

Metal Exports from the United States .- Statistics have been prepared in relation to the exports of various metals from the United States from the beginning of August, 1914, down to the end of December, and in regard to the exports of copper to different countries in recent years. The figures are reported as follows in English tons:

For the first seven months of 1914 the business exports of copper to England are returned at 38,759 tons; to France, 47,102 tons; Italy, 12,299 tons; Germany, 86,298 tons; Austria, 13,611 tons; Holland, 49,380 tons; and Belgium, 2,338 tons.

Catalogues and Lists.—Messes. Greenwood and Batley, Ltd., Albion Works, Armley Road, Leeds.—Eight-page illustrated pamphlet, describing their De Laval steam turbines for electric lighting and various industrial purposes, and giving a list of works and factories where they are in service; also an eight-page illustrated pamphlet giving full particulars of a 300-kw. De Laval mixed-pressure turbine and dynamo of their make installed at the Griff Colliery near Numeaton

mixed-pressure turbine and dynamo of their make installed at the Griff Colliery, near Nuneaton.

MR. A. H. AVERY, Fulmen Works, Tunbridge Wells.—Price leaflet of Fulmen automatic out-in and cut-outs.

MESSES. JOHNSON & PHILLIPS, LTD., Charlton, S.E.—Three new catalogues. One of 52 pages contains brief descriptive notes, with prices and fllustrations, of a wide range of watertight electric light fittings—single light vertical fittings, mill fittings, English china, acid and damp-proof fittings for chemical works, laundries, &c., shop window fittings, iron cluster fittings for metal-filament lighting, street lighting lanterns and globeless cluster fittings, hand lamps, ship fittings, &c. A 12-page price list of steel conduits and fittings, enamelled and galvanised. A 28-page catalogue of electric light installation accessories, including bayonet lampholders, switch-holders, weatherproof holders, ceiling roses, wall plugs, tumbler switches, switchplates, cut-outs, wood blocks, wood casing, porcelain cleats, &c.

The General Electric Co., Ltd., 67, Queen Victoria Street, London, E.C.—Now edition (the eighteenth) of their catalogue of

London, E.C.—New edition (the eighteenth) of their catalogue of electric bells and accessories. It consists of 80 pages of illustrated descriptive notes and prices of a wide range of manufactures, including many qualities and types of bells, indicators, relays, pushes and pulls, burglar alarms, cells, many accessories, and lightning conductors. Several pages are devoted to diagrams of connections and a numerical index.

MESSES. HAYLOCK & HANLETT, 63, Queen Victoria Street, London, E.C.—Price leaflet of the "Penlite" electric pocket torchlight, which is provided with a clip so that it can be carried in the pocket beside the fountain pen.

Private Arrangements.—C. S. Mayfield, electrical engineer, trading as J. T. Mayfield & Co., 63, Cannon Street, London, E.C.—A further meeting of the creditors of the above was held a few days ago, at the offices of Messrs. Corfield and Cripwell, Balfour House, Finsburv Pavement, E.C., when the representative of Messrs. Siemens Bros, was elected to the chair. The approximate statement of affairs presented showed liabilities of £677, of which £517 was due to the trade, and £100 to the debtor's wife, while the mother was a creditor for £60 in respect of the arrears under an annuity. After allowing £14 for preferential claims the assets were estimated to realise £185, or a deficiency of £492. The household furniture was claimed by the debtor's wife. Mr. P. Houston said that at a previous meeting a resolution was passed that a deed of assignment should be executed with Mr. G. E. Corfield as trustee, for the benefit of creditors, provided the debtor's mother agreed to give up the charge she held on the book debts, and that she ranked as an ordinary creditor. In pursuance of that resolution a deed of assignment was duly executed to Mr. Corfield, and the solicitors acting for the mother had agreed on her behalf to withdraw the claim to the book debts and to rank with the ordinary creditors, provided all the creditors agreed to the deed of assignment. Under the circumstances the creditors unanimously decided to confirm the deed already executed.

DUBBELL, WALKER & Co., LTD., 10, Bush Lane, Cannon Street, London, E.C., electrical contractors.—The creditors interested herein were called together recently, when it was reported that a conference of the larger creditors was held in March last as several firms were suing. Since then some of the creditors had continued their actions, with the result that it had been necessary for the Private Arrangements.—C. S. Mayfield, electrical

conference of the larger creditors was held in March last as several firms were suing. Since then some of the creditors had continued their actions, with the result that it had been necessary for the debenture - holder to appoint a receiver. The company was registered on November 10th, 1911, with a nominal capital of £3,000, of which £2,002 was subscribed in cash and 998 shares were issued as fully paid. A debenture was issued for cash for £1,000, and on June 6th Mr. H. Dennis was appointed Receiver. The company had certain contracts for the supply of palm oil machinery, but it was stated that the contracts had not been proceeded with. The company had incurred a substantial loss in connection with the transaction to the extent of at least £500. They had also been concerned in litigation with regard to a patent, in which they been concerned in litigation with regard to a patent, in which they were unsuccessful, and all the machinery in connection with the patents had had to be destroyed. Some little time ago the company patents had had to be destroyed. Some little time ago the company obtained a concession for the supply of electricity to the town of St. Heliers, Jersey, and negotiations had been pending for the option to be transferred to another company. The result was that arrangements had been made for the transfer to take place, and the company were to be paid £1,500 in cash and £3,000 in shares, but the cash to be received was already charged to the extent of £800. The debenture-holder had hoped to make a proposal to the creditors, but nothing definite had been arranged, although it was hoped at a later date it would be possible for some offer to be submitted. It was suggested that a Committee should be appointed to negotiate with the Receiver and to report to the creditors, and that another meeting of oreditors should be held about July 15th. that another meeting of creditors should be held about July 15th. The other assets of the company, apart from the concessions, amounted to £1,128. The liabilities, in addition to the debentures, amounted to £1,128. The liabilities, in addition to the debentures, were £4,680, of which £1,920 was due to trade creditors, £1,600 was money lent, including an overdraft at the bank, £300 was for rent, rates, &c., and £860 fer other debts. The creditors decided to appoint a Committee consisting of the representatives of Messrs. W. T. Henley's Telegraph Works £653, the Sun Electrical Co. £398, the General Electric Co. £121, Tudor Accessories Co. £123, and Mr. E. H. Hawkins (Messrs, Poppleton, Appleby & Hawkins).

Liquidations.—PINTSCH'S ELECTRIC MANUFACTURING Co., LTD. — A meeting of creditors is called for June 29th at Friars House, New Broad Street, E.C., by the liquidator, Mr. H.

Woodburn Kirby.

East Coast Development Corporation, Ltd.—Mr. Justice Neville, in the Chancery Division last week, appointed a receiver and manager on the application of the Union of London and

BUENOS AYRES PORT AND CITY TRAMWAYS Co., LTD. Chancery Division, last week, three motions with regard to this company's affairs were before the Court. A receiver was appointed to act at once.

Australian Imports.—We have received from the Australian Imports.—We have received from the Australian Association of British Manufacturers and their representatives a copy of the tabulated statement compiled by H.M. Trade Commissioner in Australia, showing the trade of the United Kingdom, Germany and the U.S.A. in competition. It is stated that the U.K. share of the Commonwealth imports of competitive manufactured merchandise (January to June, 1914) was 61°9 per cent. We extract the following figures. The percentages in the right-hand section of the table show the proportion of competitive merchandise of United Kingdom origin—taking into account imports from all countries of competitive manufactured merchandise—directly imported into each of the six States of the Commonwealth:— Commonwealth :-

## LIGHTING and POWER NOTES.

Aberdare.—Cottage Lighting.—Subject to the cable being extended, the U.D.C. has decided to have the electric light installed at the Council's tenements at Abernant at a cost of \$3 per house, the tenants to pay an increased rental of 6d. per week to cover the cost of current supplied.

Arbroath.—STREET LIGHTING.—The Arbroath Electric Light and Power Co. has informed the T.C. that it will be prepared to renew the contract for street lighting for a period of seven years, when the present restrictions on public lighting are withdrawn, at £280 per annum as before. Owing to the unsettled conditions the company did not see its way to differentiate for conditions the company did not see its way to differentiate the shorter periods of three and five years, and as the cost of supplies had greatly increased it was unable to offer any reduction in price. The Council has decided to allow the present contract with the company to run out, and not to enter into any contract for lighting with either gas or electricity until the present lighting restrictions are withdrawn.—Dundee Advertiser.

Aberdeen.—RESTRICTED LIGHTING. — Owing to the restricted public lighting, the Corporation Lighting Committee reports that there has been a saving of £6,000 for the year on this matter.

Canada.—An agent in Dartmouth (Nova Scotia) wishes to take up agencies of United Kingdom manufacturers of electrical apparatus, fittings and accessories. Application should be made in the first instance to the Board of Trade Commercial Intelligence Branch in London. Reference, C.I.B. 31,659.

Russia.—An agent wishes to represent United Kingdom manufacturers of locomobiles, steam turbines, Diesel and semi-Diesel engines, generators and electrical fittings. Application should be made in the first instance to the Board of Trade Com-mercial Intelligence Branch in London. 'Reference, C.I.B. 30,132.

Ironsafe Power Switchboards.—Twenty years ago the ironclad medium pressure type of switchboard was unknown. To-day it is to be found controlling the electric power and lighting of many a modern factory and workshop. The construction of solid steel, iron, copper and mice is the embodiment of "strength," and the exposure of "live parts" in open boards has given way to the totally enclosed ironsafe fool-proof type of switchboard. The original inventors and developers, MESSRS. BEBRY, SKINNER & Co., fool-proof ironclad switchbear specialists. 78 Unper Thames Street. fool-proof ironclad switchgear specialists, 78, Upper Thames Street, London, England, inform us that they possess over 600 original designs and patterns dealing with every class of work, every type of cable connection, and every conceivable electrical hazard.

Fire.—Damage estimated at £1,000 was done by fire on 16th inst. on the premises of MESSRS. DAVID BONE & Co., electrical engineers, Bishop Street, Anderston, Glasgow.

Australia: Catalogues Wanted .- A firm of merchants and agents invites British manufacturers of arc lamp carbons, metal conduits, porcelain insulators, and electrical accessories, to send catalogues and prices. He desires to take up agencies. Applications should first be made to the B. of T. Commercial Intelligence Branch, London, and later to H.M. Trade Commissioner at Sydney.

Correction .- The name of the amalgamated battery company referred to on page 855 of our last issue should have been given as "Pritchett & Gold and Electrical Power Storage Co., Ltd.," not Pritchetts & Gold, &c.

For Sale.—Farnworth U.D.C. has for disposal one Lancashire boiler, 30 ft. × 7 ft. 6 in., with accessories. Tenders by July 14th. Particulars are given in our advertisement pages.

Australia. — ELECTRIC COOKING. — The Australasian Temperance and General Mutual Life Assurance Society, Ltd., has given an order to Mesers. W. G. Watson & Co. for the supply of 180 electric ranges and stoves for the new T and G residential flats building at Hyde Park, Sydney. The order is valued at £750, and the apparatus will be of the Hotpoint type, manufactured by the Hotpoint Electric Heating Co., of Ontario. The complete plant is capable of cooking for 1,170 people.—Com. Engineer.

The Mount Gambier Council (South Australia) has, at the recovert of a level company decided to apply for an Order in

request of a local company, decided to apply for an Order in Council to install electricity in the town.

The Kyneton (Victoria) Council has decided to obtain a report

The Kyneton (Victoria) Council has decided to obtain a report from a consulting electrical engineer on the lighting of the municipality, and also of the town of Trentham.

The Williamstown Council (Victoria), which had earmarked £18,000 out of the £35,000 proposed loan from the Government, for the installation of a municipal electric lighting scheme, has decided to make other arrangements for the floating of a loan. It was stated that the object of the Government in offering to lend money to municipalities was to provide employment, and as a large portion of the lighting loan would be sent abroad for the purchase of machinery, that object would be defeated if the full amount of the loan was granted.

The Lillydale Shire Council (Victoria) has established an electric

The Lillydale Shire Council (Victoria) has established an electric lighting system in the township of Ringwood, with extensions to Croydon, at a cost of £1,600.

The municipality of East Fremantle (W.A.) proposes borrowing £1,428, to which will be added £8,571 by the municipality of Fremantle for additions to power house plant, &c., tramway extensions, cars, and mains and transformers for lighting

The W.A. Railway Commissioner has notified the Fremantle Council that it was the intention of the department in the near future to supply current to the local railway station, harbour works and other Government departments direct from the new power station in East Perth, also to the naval base at Cockburn Sound.—Tenders.

The Sydney Daily Telegraph states that the North Sydney Co has decided to enter into a contract for five years for street lighting by gas, at £4 per lamp per annum. It was pointed out that the Sydney City Council's offer was £3 2s. 6d. for electric light, and if the latter gave light equal to the gas there would be a saving to the Council of about £1,000 a year. It was finally considered that it would be to the interests of the Council to enter into the

agreement with the gas company.

A Sydney company has taken up a large area of coal-bearing land on the western boundaries of the Corrimal-Balgownie, Bellambi and Bulli Collieries, N.S.W. It is intended to proceed at once with the development of the property, and for this purpose a modern electrical power plant is to be installed. By boring, a seam of coal 8 ft. 3 in, in thickness was proved at 1,614 ft. deep.—

Buxton.—Proposed Loan.—The U.D.C. has written to the L.G.B. urging the granting of a loan of £1,000 to cover excess expenditure up to March 31st and to meet present urgent requirements (of the electricity department. The price of current is to be increased from the date of the taking of the meter index in Lone. index in June.

Barnstaple.—YEAR'S WORKING.—The annual accounts of the Connoil's electricity undertaking show total loans authorised amounting to £32,442, and amount at present outstanding £31,128. Working expenses for the year were £3,198, and the amount carried to net revenue account was £2,032.

Bradford.—The Corporation is to supply current for ighting and power purposes to Dumb Mill, Frizinghall. When the installation is complete it will comprise the largest drive of spinning plant in Bradford. In this connection it is pointed out that at the present time—with coal at such abnormal figures—it would easily be a paying proposition for a mill owner to shut down his old plant and replace it with an electric installation, especially a where room is consideration. so where room is a consideration.

Burton-on-Trent. — YEAR'S WORKING. — The annual Burton-on-Trent. — YEAR'S WORKING. — The annual report of the Corporation electricity department shows that during the past year 8,000,000 units were sold. and that the units used for heating and cooking had increased by over 300,000. The installation of new plant resulted in a reduction during the last two years in the annual cost of fuel of £1.200, although one-third more electricity was generated. During the year the profit-sharing system came into operation, and with regard to the electricity department, each man would receive about 6 per cent. on his total wages for the year. The year's profits were £3,056, as compared with £3,747 for the iprevious 12 months.—{Burton Evening Gazette.

Bury (Lancs.).—The :T.C. has applied to the B. of T. for consent to the erection of a 6,600-volt overhead line in the

Canterbury.—YEAR'S WORKING.—The accounts of the Corporation's electricity undertaking for the past year show that the working expenditure was £6,135, an increase of £400; and the revenue amounted to £12,053, an increase of £901 over the previous year; the gross profit was £5,917, as against £4,415, and the net profit £1,891, as against £1,436.

Castletownbere.—L.G.B. Inquiry.—An inquiry has been held into the application of the District Council to be vested with urban powers for the purpose of carrying out a scheme for lighting the town by electricity.

China.—The town of Kongmoon, situated near Canton, China.—The town of Kongmoon, situated near Canton, is making rapid progress with its electrical development. It is now four years since the present electricity station was equipped with a 40-kw. generator, belt-driven from a suction gas engine. Having at last overcome the superstition of the natives, electric light has become so popular that further extensions have now become imperative, and three 75-kw. twin-cylinder gas engine sets with producer plant, the engines driving single-phase generators, are to be installed, the contract having been secured by Messrs. Shewan, Tomes & Co., of Hong-Kong. It is expected to be ready to start up in about four months' time.

Continental.—Russia.—Engineer Nevodnichansk according to the Vilna Viestnik, is preparing plans for the installation of a fifth set of machines in the Vilna town electric station regarding which negotiations have been taking place with English, Swedish and Swiss firms.

The Town Council of Ryszan is engaged on a project for providing the town of Ryszan with electricity. The acquisition of a fourth set of plant and the extension of the electric lighting of the town, besides tramways, &c., is in contemplation.

A group of capitalists and engineers in Pinsk is asking for a concession for the electric lighting of Pinsk. The group will proceed to the work of construction immediately on receiving the concession.

On April 4/17th a start was made in firing two boilers at the Petrograd central electric station with petroleum. The fitting of the remaining boilers to burn petroleum is being actively proceeded with.

The Siemenoff (Nizhi-Gorod Government) T.C. has appointed a select committee to examine a project to install electric lighting in the town.

At Saratoff it is proposed to construct a special electric station for the Post Office buildings. It is calculated that it would cost 20,000 roubles per annum to purchase energy, whilst it would only cost about 10,000 roubles to generate it at the institution. The cost of the station is estimated at 50,000 roubles. It is contemplated also to sell current to other concerns, and thus to improve the financial position of the enterprise.

A town electric station in Vladikavkaz in the Caucasus is under

The Minister of the Interior has confirmed a contract between the town of Slutsk and the engineer, V. V. Dmitrieff, for the installation of electric lighting in the town.

**Dublin.**—The Corporation, by 34 votes to 11, agreed to the Electricity Supply Committee's recommendation for an norease in lighting charges of one halfpenny, and in power rates of a farthing per unit.

Edinburgh.—New Power Station.—The Corporation has finally decided to accept the estimate of the Stirling Boiler Co. for water-tube boilers for a new power station at Portobello, amounting to £32,286, although an effort was made by a minority of the Council to delay the work on the ground that the time was inopportune. Under the provisional order of last year the Corporation is bound to lay new mains by August, 1916, and to supply four parishes in Midlothian.

Exeter.—YEAR'S WORKING.—The electrical engineer's report on the past year's working of the electricity department shows a gross surplus of £8,243, and net surplus of £1,554. The total number of units sold was 1,716,350, an increase of 47,236 over the previous year. The output for tramways increased by over 8 per cent., and for power and heating by a similar amount, but reductions occurred in reviewth lighting. but reductions occurred in private lighting.

Federated Malay States.—As it is believed that the Taiping field will pay for dredging, a scheme is proposed which involves a central station for generating current for electrical dredges, capable of treating half a million yards monthly.—

Tenders.

Halifax.—RESTRICTED LIGHTING.—The local authorities, as a result of representations by the Chamber of Trade, have modified the lighting restrictions, so that tradesmen need no longer draw blinds over their shop windows and may use ordinary window lighting, but naked lights must be shaded so as not to throw a direct glare on the footpath, and no outside lights are yet permitted.

Haworth.—The Council has petitioned to be heard against the confirmation of the provisional order granted to the Keighley Corporation, in respect of the electric lighting of the urban districts of Oakworth and Oxenhope and the rural district of Keighley.

Heckmondwike.—Owing to the increased cost of coal, the U.D.C. has advanced the present prices for current by 10 per cent., with a discount for prompt payment of accounts, and withdrawn the present scale of discounts.

Heywood.—YEAR'S WORKING.—The annual report of the Corporation electricity department shows a total income of £7,121, an increase of £695. The income from traction shows an increase of £1,234, and the income from power a decrease of £2,987; and the debit balance is £927, compared with a debit balance in the previous year of £4,610. The total number of units sold was 1,287,006, an increase of 124,195. It is anticipated that by October, 1915, the Bury bulk supply scheme will be in operation.

Hucknall Torkard.—Proposed E.L.—A scheme of E.L. has been submitted to the U.D.C. by the Sherwood Colliery Co., which contemplates the extension of its electrical plant at the Hucknall pits. The company has offered to supply current in bulk to the Council when the extension of plant is complete, but the scheme will not be carried out until the termination of the war. The proposal is viewed favourably by the Council.

India.—Indian Engineering says there have been many complaints regarding the electric lighting throughout Bangalore city and station, but matters, it is understood, will be rectified by years at Sivasamudram is to be replaced by modern machinery.
Mr. H. P. Gibbs, a former chief electrical engineer to the Mysore Government, is now in Bangalore in the capacity of consulting engineer.

Ipswich.—Price Increase.—On account of the greatly increased cost of coal, &c., the T.C. has advanced the price of current for lighting from 4d. to 41d. per unit, and for heating, power, cooking, &c., including charges under the rateable value tariff by 10 per cent., from the meter readings for the June quarter.

Kettering.—Price Increase.—On account of the rise in the price of coal, the U.D.O. has decided to increase the charge for current for power purposes by 10 per cent. for the ensuing year. The price of current for lighting remains unaltered.

Liverpool.—The Mersey Docks and Harbour Board proposes to provide at the west block of the Waterloo grain ware-houses, two modern belt electric discharging elevators, at an estimated cost of £8,750.

London.—POPLAR.—The Finance Committee of the B.C. has adopted the proposals of the Electricity Committee for B.C. has adopted the proposals of the Electricity Committee for the allocation of the surplus profits of the undertaking for the past 12 months. By the adoption of this proposal, the balance in hand will be as foilows:—Net surplus for the year, £14,749, less allocation in respect of first charges, £4,823; superannuation and pension funds, £1,352; general fund, £3,500; and grant to staff, £1,000; leaving a balance of £4,073. From this has to be deducted the value of the machinery displaced during the year, less repayments on account of same and residual value of plant

£1,565; and the amount to be written off after disposal of the batteries of the north and south sub-stations, £1,605. This leaves £902 unappropriated, which it is proposed should be carried forward and ear-marked against the disposal of No. 4 generating set, which will have to be dealt with during the current year, when it is impossible to forsee any large sum available for this purpose.

KENSINGTON.-HALF-WATT LIGHTING.-The borough engineer reports that the substitution of half-watt lamps and fittings for the arc lamps in the streets of the borough has been completed. There are 112 of the latter lamps for which the Council has no further use, and instructions have been given for the invitation of offers to purchase.

STEPNEY.—LOAN SANCTION.—The Treasury has sanctioned the borrowing of £15,000 by the B.C. for mains for the electricity supply undertaking.

L.C.C.—The Finance Committee recommends the Council's s tion to the borrowing of £15,038 and £1,240 by the Stepney B.C. for the acquisition of property in connection with the electricity undertaking; part of the land is required for coal storage, and another portion to allow sufficient frontage on the river to enable a steamer to be brought alongside. The Treasury has agreed that

a steamer to be brought alongside. The freesury has agreed that sanction may be given in this case.

The Committee also recommends the Council to sanction the borrowing of £3,031 by the Hackney B.C. in respect of money spent up to March 31st, 1915, for house services. The Treasury raised no objection to the sanction.

Tydfil.—PRICE INCREASE.—The Electric Merthyr Traction and Lighting Co., Ltd., has decided to advance the price of current for lighting at Morthyr, Penydarren and Dowlais to 4½d. per unit., less ½d. per unit for prompt payment of accounts, as from July 1st.

North Ormesby.—Owing to the refusal of loans for the laying of additional mains, the Middlesbrough T.C. has had to refuse the request for the mains to be extended to North Ormesby.

Portstewart.—E.L. Scheme.—The Town Commissioners have decided to request Messrs. McLenshan to proceed with the scheme for lighting the town with electricity.—Irish News.

Northampton. - B. of T. Inquiry. - Mr. A. Northampton. — B. Of T. INQUIRY. — Mr. A. r. Trotter held an inquiry on Tuesday last into the application of the Northampton Electric Light and Power Co., Ltd., for the consent of the B. of T. to the construction of a new generating station on the River Nene, near the Midsummer Meadow. In support of the application it was stated that the output was increasing so rapidly that it was imperative to make extensions; at the present time it that it was imperative to make extensions; at the present time it was 30 per cent. more than for the same period of last year, and 80 per cent. of the current sold was for motors. Referring to some of the objections, the inspector stated that no one would be more sorry to spoil the view of the country than he, but the Act of Parliament did not protect that. The town clerk stated the main objection of the T.C. was that the station would be outside the borough, and the inspector said the question of rateable value was rather outside the scope of the inquiry. As regarded the objection to smoke from the new works, he did not anticipate any nuisance in view of the modern appliances to be installed.

Preston.—Price Increase.—The T.C. has been informed that the National Electric Supply Co. had notified an increase of 1d. per unit in the price of electricity for lighting.

-PRICE INCREASE.—From October next the Radcliffe.price of electricity is to be increased—for lighting by 10 per cent. and for heating and power by 15 per cent.

Rochdale.—PRICE INCREASE.—The Electricity Committee has decided to recommend that the charges for electricity for lighting be increased by 10 per cent., and for power purposes (including tramways) by 15 per cent. The new charges are to come into force in the September quarter.

Salford.—New Plant.--The Electricity Committee has asked for permission to apply for sanction to borrow £19,225 for the supply and erection of a 5,000-kw. turbo-alternator, together with the requisite foundations, piping, &c., at the Frederick Road station, and £5,250 to cover the cost of plant, &c., required in contaction with the additional applies of plant, nection with the additional supply of power.

Shrewsbury .-- YEAR'S WORKING .-- There was a surplus on the electric light undertaking for the past year of £785, as compared with £131 in the previous year.

Stockport.—New Electricity Charges.—The following charges for electricity have been fixed by the T.C., and come into operation next week:—Lighting: First 25 units consumed into operation next week:—Lighting: First 25 units consumed per quarter, 5d. per unit, all in excess at existing rates, plus 10 per cent. increase. Power: Existing rates to be charged, and coal clause to apply to all consumers. Heating: First 25 units per quarter at 1½d. per unit, all in excess at existing rates, plus 10 per cent. Accounts under £1 are to be net, and other accounts are to be subject to 1½ per cent. discount for payment on the due dates. A minimum charge of 7s. 6d. per quarter is to be made to all consumers. Tempo (Co. Fermanagh).—L.G.B. Inquiry.—An inquiry was held at Enniskillen last week into an application by Enniskillen Rural Council for urban powers for the lighting of the village of Tempo.

Willesden.—The Electricity Committee of the U.D.C. proposes to extend the mains in order to supply the Picture Palace at Stonebridge, provided the company interested agrees to advance £250 toward the cost, such sum to be repaid by means of deductions from the accounts for the current at the rate of ½d. per unit

## TRAMWAY and RAILWAY NOTES.

Bolton.-In connection with the application of the Amalgamated Association of Tramway Workers for an advance of a farthing per hour on July 1st next, and a further farthing on January 1st, the Association is to be asked to send a deputation to the next meeting of the Tramways Committee.

Burton-on-Trent.—YEAR'S WORKING.—There was a gross profit on the Corporation tramways, for the year ended March last, of £3,531, and a net profit of £838: £1,500 has been placed to renewals fund, making a net loss of £662.

Edinburgh. — ELECTRIC VEHICLE. — A new 30-cwt. Edison truck has been purchased by the Electric Lighting Department. The truck is capable of travelling 40 miles on one charge.

Glasgow.—YEAR'S WORKING.—The abstract statement of the revenue and expenditure of the tramway department for the year ending May 31st shows that there was a total revenue of £1,076,868, against a total of £1,083,847 for the previous year. The total expenditure was £735,987, and included £51,816 spent in connection with the European war in the provision of allowances to employés who have joined the Colours, the raising and equipment of the Glasgow Tramways Battalion, and other relative outlays. The expenditure for 1913-14 was £676,277. The net revenue account amounted to £406,717, compared with £472,558, out of which the following appropriations were made this year:—Rent of Paisley lines £5,559, against £5,830 last year; interest on capital, £79,797, against £82,921; sinking fund, £105,491, against £10,2607; income-tax, £22,790, against £14,056; Parliamentary expenses, £8,818, against £609; and renewal and depreciation, £172,310, against £212,642—total £393,866, against £418,566. The surplus to be handed over to the Common Good Fund this year was £12,951, against £53,892. Glasgow.—YEAR'S WORKING.—The abstract statement was £12,951, against £53,892.

Greenock.—Trailer Cars.—The Corporation is to allow the local tramway company to use trailer cars early in the morning, at meal hours, and in the evening when men are coming from work.

Heywood,-YEAR'S WORKING.-The report on the Heywood.—YEAR'S WORKING.—The report on the year's working of the Council's tramways shows a total income of £11,626, compared with £11,838 in 1914, and total expenditure amounting to £7,944, as compared with £7,068. The gross profit was £3,681 last year, and £4,770 in 1914; and the net loss £1,042, compared with a profit of £85 in 1914. The car-miles run numbered 269,087, against 269,426; the passengers carried, 2,268,331, against 2,322,007; the units used, 376,726, against 426,792; the units per car-mile 140, against 158; and revenue per car-mile 1037d., against 1054d.

Hull.—Fenale Labour.—The tramwaymen have entered a strong protest against the proposal of the Tramways Committee to employ women as conductors, and many of the men have declared that they will refuse to run the cars if the proposal is carried into effect. The tramway manager has opened a register for women, which has met with an excellent response.

Oldham.—PARCELS DELIVERY.—A proposal is on foot for purchasing a motor delivery van for the parcels delivery department of the tramways, and the general manager is to prepare a report on the probable cost and revenue.

Rochdale.—The Tramways Committee has agreed to receive a deputation from the tramway workers respecting their application for a permanent advance of a penny per hour in lieu of the war bonus, which is stated to be calculated to operate

Southend-on-Sea.—As a number of employes on the tramcars and motor-buses are joining the Army, the T.C. has decided to fill the vacancies with men not eligible for the Forces.

## TELEGRAPH and TELEPHONE NOTES.

Russia.—The inauguration of a new wireless station, the largest in Russia, which has been erected during the war, took place last week, messages being exchanged between the Chairman of the Duma and the Speaker of the House of Commons.

-The American Consul at Seville states that for some time there has been an agitation on foot for the extension of some time there has been an agitation on root for the extension of telephone lines to the various towns and villages surrounding Seville. The town at present has an urban system which is more or less satisfactory, but which so far has declined to extend its lines outside the city limits. An interurban company serves the different capital cities of Spain, and connection by its lines can be had from sufficiently with Madrid, Granada, Malaga, Cadiz, Huelva, Cordova and the other larger cities, but this system is not directly connected with the urban system. The present agitation looks towards the combination of the interurban with the urban system, and the extension of the interurban system to the surrounding towns and villages. The six provinces known as Sevillian Andalusia contain a population of over 5,170,000, with an area of 54,059 sq. miles. There are 48 cities in the district and 319 towns, and there are said to be, according to the latest statistics, 533,047 buildings in this territory. The interurban company which contemplates the proposed extensions is known as the Compania Peninsular de Telefonos Interurbanos, 25, Celle Tetuan, Seville. All correspondence with the company and all literature should be in Search in Spanish.

Telegraph Operators.—A number of men between the ages of 17½ and 19, who have attended technical schools, are required by the Royal Engineers for the purpose of training as telegraph and wireless operators. They will be required to enlist in the Royal Engineers at the usual rates of pay. They will then be sent to the General Post Office or one of its branches for the course of training, after which they will be attached, according to the exigencies of the service, to the Royal Engineers or to the Royal Aircraft Corps.

Halifax. — July 1st. Corporation. One 5.000-kw. turbo-alternator complete with condenser; two natural-draught chimney-type cooling towers; one water-tube boiler, superheater and mechanical stokers. See "Official Notices" June 18th.

India. — Our special correspondent writes :—" The Commissioners for the Port of Calcutta have issued conditions and specifications and invite tenders for four 250-kw., 6,600-500-volt, 50-cycle, three-phase main transformers; four 60-kw., 6,600-500 volt, 50-cycle, three-phase auxiliary lighting transformers, together with high and low tensions witch gear for the same, for the riverside jetties and sheds at Garden Reach. Most of the for the riverside jetties and sheds at Garden Resch. Most of the gear must be fixed and in working order by January 1st, 1916, under a penalty of 100 rupees per day for each day late beyond this date. Tenders must reach Calcutta by July 27th. Under ordinary conditions two months is ample time in which to get out prices from home, but under present war conditions it will be a scramble to get out by post particulars so as to quote in time. This contract will be a useful one for any firm to get, as a good deal more three-phase gear is certain to be required later by the Port Trust."

Limerick.—July 2nd. Corporation. 180 tons of coal (anthracite peas) for delivery in August. Particulars from Mr. E. Badham-Thornhill, Borough Electrical Engineer.

Liverpool.—June 26th. Electrical supplies for three months, for Toxteth Park Board of Guardians. Mr. R. A. James, Clerk, 15, High Park Street.

London. --Metropolitan Asylums Board.-30th. Lighting installation at the Grove Fever Hospital, Teoting Graveney, S.W. See "Official Notices" June 11th.

FULHAM.—Jane 30th, 11,000 tons of coal, for the Borough electricity works. See "Official Notices" June 11th.

Manchester.—June 28th. Sanitary Committee. Additional electric lighting plant, &c., at the Baguley Sanatorium. Specifications (two guineas, returnable) from the City Architect.

Rangoon.—August 11th. Installation of a system of fire-alarms, for the municipality. Specification (10a.) from Messrs. Ogilvy, Gillanders & Co., 67, Cornhill, E.C.

Salford.—June 28th. Supply of stores, including cable, &c., for the Electricity Department. See "Official Notices" June 18th.

Spain.—August 3rd. Spanish Ministry of Public Works, Madrid. Concession for the construction and working of an electric tramway between Deusto and Ibarrecolando (Province of Vizcaya). Application has already been made for the concession for the projected line, but, in accordance with the usual plan in Spain, the scheme is being put up to public tender.

- July 26th. Sub-station - Launceston. -Tasmania. · equipment. Section I, Converter machine, switchgear, &c.; Section II, Underground feeder cable. Specification (21s.) from the City Electrical Engineer, Town Hall.

Walsall and West Bromwich.—July 5th. Lighting; heating apparatus; drainage and septic tanks, for Unions Joint Committee. See "Official Notices" June 18th.

#### CLOSED.

Australia.—The Hawthorn Tramway Trust has accepted the following tenders in connection with the construction of the line from Melbourne to Burwood via Swan Street, Richmond;

Buffer battery.—Sutherland & Ashman, on behalf of the Chloride Accumulator Co., £2,732.
Booster.—Sutherland & Ashman, on behalf of Mather & Platt, £789.
Motor generator.—British Westinghouse Co., England, £140.
Switchboard.—British Westinghouse Co., £336.

-The U.D.C. has accepted the tender of Avlesbury.— Mesare. Drake & Gorham for Osram metallic-filament lamps for street lighting, at £33.

Glasgow.—A T.C. sub-committee recommends acceptance of an offer by Messrs. Ferguson, Pailin & Co. for a switch-board at Govan electricity station, at £1,923.

Government Contracts.—The following tenders have been accepted during the past month by the Government Departments named :-

London. — STEPNEY. — The Electricity Committee has considered the tenders received for the supply of coal and coke for the ensuing year, and, as the prices quoted are so high, it is unable to recommend the acceptance of any of the tenders. The Committee recommends that the Standing Committees of the Council be authorised to accept, during the pleasure of the Council, offers or tenders for the supply of coal brought to their notice by the responsible officers concerned, particulars of such offers being subsequently reported to the Council for formal approval.

The Electricity Committee has accepted offers of 3,000 tons of

The Electricity Committee has accepted offers of 3,000 tons of coal for the electricity undertaking, at prices ranging from 18s. 9d. to 22s. a ton; and recommends the acceptance of the tender of Mr. W. Badger, at £61, for the supply of piping, valves, &c., in connection with the air-heaters at the Limehouse generating station.

Salford.—The Electricity Committee recommends (1) the acceptance of the tender of the British Westinghouse Co. for one 1,000-kw. rotary converter and transformer (including midwire booster), for £2,820; and (2) the purchase from Messrs. W. T. Glover & Co., Ltd., of high-tension cable, amounting approximately to £1,457, required to connect the electricity station, Frederick Road, Pendleton, to the works of the Broughton Copper Co., Ltd.

Watford.—The Guardians have accepted the tender of

Messrs. E. Brook, Ltd., at £28 14s., for an electric motor.

The E.L. Committee is purchasing 2,000 tons of Newdigate peas, during the next 12 months, from Messrs. E. Foster & Co., at 21s. per ton, subject to 2d. per ton increase per 2½ per cent. rise in the miners' wages, during the period of the continuance of such rise

West Ham.--The Education Committee of the T.C. has accepted the tender of Mr. J. T. Halsey, at £163, to carry out the electric lighting work at the Knox Road Special School.

## FORTHCOMING EVENTS.

Physical Society.—Friday, June 26th. At 5 p.m. At Imperial College of Boience, South Kensington, S.W. Papers on "A Theory of the Electrical Resistance of Metals," by Sir J. J. Thomson, and on "An Unbroken A.C. for Cable Telegraphy," by Lieut. Col. Squier.

#### NOTES.

Lamp Litigation. — We find that the notice of the Sceando Lamp Co., which appeared on page 20 of our advertisements last week, was wrongly described as a "Patent" notice. The action was one in which the Osram Lamp Works applied for an injunction restraining the defendants from using the word "Axial." No question of patents arose in this action. The patent action pending has not yet come on for hearing.

Electricity in Farming.—For the benefit of those who may be interested, we may mention that the motors illustrated in the views of Hereford flour and cider mills, on page 869, last week's issue, were supplied by the British Thomson-Houston Co., Rugby.

The Electric Vehicle Committee,—A meeting of this Committee was held on June 11th. Mr. A. R. Fearnley, the general manager of the Sheffleld Corporation Tramways, has been co-opted a member of the Committee as the representative of the

Municipal Tramways Association.

It was reported that the sales of No. 3 (June) issue of "The Electric Vehicle" had been very satisfactory, although the number Electric Vehicle" had been very satisfactory, although the number had only been out a few days, and it was decided to send in a request that evidence be heard by the Special Committee of the L.G.B. on Motor Traffic with regard to the effect of the use of electric vehicles, the Secretary being instructed to give evidence if the application was acceded to.

The Secretary was instructed to write to the representative Electrical Institutions in the Colonies suggesting the advisability of adopting the Committee's Standards with regard to electric vehicles.

The next meeting will be held in Sentember.

The next meeting will be held in September.

Smoke Nuisance.—At the Manchester City Police Court, last week, Messrs. Chas. Macintosh & Co., Ltd., of Chorlton-on-Medlock, were summoned by the Manchester Corporation for certain recent emissions of dense black smoke from their works chimneys. Mr. Clay, who appeared as the firm's representative, said he did not question the facts as stated by the Corporation solicitor, but he objected to the Magistrates issuing an order calling monthem to shots the missions as they were vellentarily having upon them to abate the nuisance, as they were voluntarily having the whole of their plant electrified. The steam drive would be absolutely superseded, he hoped, before the end of September. This would show that the directors were doing all they could to keep down black smoke. He also asked the Court to remember that firemen were extremely hard to keep, as so many were enlisting. There was also the coal question to take into consideration; they were entirely in the hands of colliery owners, and had to put with any kind of coal that could be supplied.

up with any kind of coal that could be supplied.

The Bench made the abatement order asked for by the

Scottish Engineers' Wages .- The Financier states that conference was held in Glasgow on Tuesday between representatives of the North-West Engineering Trades Employers' Association and the Clyde District members of the Amalgamated Society of Engineers, to consider a claim by the men for an increase of 1d. per hour time rates and 5 per cent. piece rates. The conference proved abortive, the employers being anable to see their way to grant the advance. It is expected that the men will decide to refer the matter to the Central conference, and, failing a settlement there, to Government arbitration.

Electrolytic Disinfectant.—A report of the Public Health and Housing Committee of the Poplar Borough Council just issued covers the whole history of the manufacture and use of electrolytic disinfectant in the borough. During the working of electrolytic disinfectant in the borough. During the working of the apparatus—a period of nine years—many improvements have been introduced; cheap metal drums have been substituted for the glass vessels originally used to receive the fluid, and a double cell of slate has been constructed which prevents "creeping" of the current from one cell to another. The present cells are of earthenware, instead of slate, but the Committee prefers the new slate pattern. Since the plant was installed 381,794 gallons of fluid have been manufactured at a cost for electricity of £402, and for materials of £315 (under 1d new relief). Interesting details fluid have been manufactured at a cost for electricity of £402, and for materials of £345 (under id. per gallon). Interesting details are given, at considerable length, of the cost of the various items involved in the manufacture. The fluid produced in Poplar is stable for long periods, and is suitable for both municipal and commercial purposes. It is stated that plants have been supplied to Guernsey, Gateshead, Finland, Buenos Ayres, and Bangoon; a similar plant has been installed at Portsmouth, for the manufacture of disinfectant from sea water, using the method for rendering it stable that has been adopted in Poplar, and Finchley Council has ordered an installation. Council has ordered an installation.

Fatalities,—At Manchester, on Monday, an inquest was held on a fitter named Marshall (30), who was killed on Saturday. Deceased was attending to an auto-switch on an electric starter when the current was switched on. Robert Lilley, wood machinist at the timber works of Messrs. J. & W. Bellhouse, Miles Platting, said that when he had done his work on Saturday he went with deceased to the sub-station at the works to switch off the current. He switched the current off, and two minutes later he switched it on again at the request of the head horsekeeper. Afterwards he found Marshall lying beside the switch in an unconscious condition. Death took place before the arrival of the doctor. The cover of the switch had not been replaced, but witness had no idea that Marshall was going back. Mr. H. Seal, H.M. Inspector of Factories, said the requirements of the Factory Acts were carried out. A verdict of "Accidental death" was returned.

A Southport boy, aged 8 years, was killed on Sunday on the Lancashire and Yorkshire Railway. He was playing on a bridge and, climbing on to the parapet, fell on to a live rail below. By the time a doctor arrived the lad was dead.

At the inquest on Monday the Coroner pointed out that the bridge was a public one and the railway company should make it as perfect as possible. The jury added a rider to their verdict that the bridge and approach should be bounded to a height of 6 ft.

Two employés of the Victoria Falls Power Co. were recently killed. said that when he had done his work on Saturday he went with

Two employes of the Victoria Falls Power Co. were recently killed. It appears that they were travelling in a large motor trolley conveying an immense cog-wheel to Brakpan. In descending a hill the steering gear went wrong, and the whole outfit went over an embankment, turning a somersault. The two men killed were named Willy and Blaney, and four others escaped with slight injuries.

Coal Supply.—At the adjourned meeting, on the 22nd inst., of Members of Parliament interested in the question of coal supplies, the Committee of 12 which had been considering the matter formulated two recommendations, which were adopted. They were as follows:

1. That during the continuance of the war the maximum price for home consumption and for our Allies of coal at the pit-head be fixed on the basis of prices charged at the pit-head for sub-stantial quantities of each class of coal sold during the 12 months preceding the war, with an addition of 4s. 3d. per ton, or other such sum as may be prescribed, to cover the increased costs owing to the existence of the war.

2. That the rate of freight for coasting steamers employed in the coal trade be fixed on the basis of the rate charged for freight during the 12 months preceding the war, with an addition of such sum as will reasonably cover the increased cost owing to the existence of the war, and that the Government be urged to assign a further number of the interned steamers for the use of the coal

Later, it was resolved by a majority of seven or eight that the Government should be requested to regulate the price of coal charged by the merchant to the consumer.

All the resolutions will in due course be submitted to the Government.

Charge Against a Contractor.—Before the Tunbridge Wells Magistrates, on Monday, Henry Arthur Stonham, an electrician and wiring contractor, was summoned for fraudulently consuming certain electricity, of the value of 1d., the property of the Corporation, at Mount Ephraim, between May 29th and June 12th. The Town Clerk conducted the prosecution, and said that although the sum involved was only 1d., the case was an important one. The proceedings were taken under Sec. 23 of the Lighting Acts of 1892 and the charge was hyleft one of stepling electricity. one. The proceedings were taken under Sec. 23 of the Lighting Acts of 1882, and the charge was briefly one of stealing electricity. Defendant, being an electric lighting contractor, was thoroughly cognisant of what he was doing. To ordinary consumers the charge was 4½d. per unit for lighting, and 1d. per unit for power and heating, but wiring contractors paid only 3d. for lighting, as their premises, when lighted, formed an advertisement for electricity. They could not tall the amount of current that record tricity. They could not tell the amount of current that passed through the meter at the cheaper rate, but defendant had been using current for one purpose and paying for it for another purpose. using current for one purpose and paying for it for another purpose. A good deal of evidence was given. Mr. J. E. Pownall, assistant borough electrical engineer, said that he visited the premises on May 29th, and when he switched off the lighting meter the lamp in the office remained on. There were only six lamps on the lighting circuit. Mr. R. N. Torpy, the borough electrical engineer, said that when he visited the premises the lighting lamps were connected with the power and heating circuit. After hearing the case for the defence, the Chairman of the Bench said he considered the case proved, and fined defendant £3.

Volunteer Notes.—Engineering Institutions' Volunteer Training Corps.—Telephone No.: City 682. Headquarters (temporary), Marconi House, Strand, London, W.O. Drill Centre.—Headquarters of London Electrical Engineers, 46, Regency Street, London, S.W.

Company Orders, by Lieut.-Col. C. B. Clay, V.D., Commandant,

k ending July 3rd, 1915

On Mondays, Wednesdays and Fridays, drills at 6.30 and 7.30 p.m. Technical instruction will be given by Instructors of the London Electrical Engineers for one bour, and squad and platoon instruction for one hour.

Orderly Sergeant, L. A. Levy; Recruit Orderlies (Aquad 3), H. de P. Birkett; (Squad 4), A. T. Scorey.

E. G. FLEMING, Company Commander and Acting Adjutant.

3RD. BATT. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUN-TEERS).—Battalion Orders by Colonel S. G. Grant (Officer Commanding), Thursday, June 24th, 1915 :-

## WEEK-END PARADES.

Saturday.—The Battalion will parade as strong as possible at Baker Street Station at 2.30 pm. Proceed by train to Dollis Hill, where they will detrain. The right-half Battalion, under the command of Mr. H. O. King, will proceed by march route and take up a defensive position between Kingsbury Green and Chalk Hill House with the object of defending the Camp. The left-half battalion under the command of Mr. W. Ridd, will proceed by march route rid the Grove, Dollis Hill, and thence in a north-westerly direction towards the Brent Reservoir, and endeavour to make their way into Camp, using any of the roads south of the Edgware main road and north of the Neasden-Dollis Hill road. All roads north

road and north of the Neasden-Dollis Hill road. All roads north of the Edgware main road and south of the Neasden-Dollis Hill road, are out of bounds. Reference Mar.—Ordnance Survey, London (North). Scale.—I in, to the mile.

Sunday.—6 a.m.—Reveille. 7 a.m.—Parade under Sergeant-Major. All men remaining in Camp—handling of arms. Mr. F. H. Stevens will superintend this Parade. 10 a.m.—Church Parade. 10.29 a.m.—Company and Platoon Drill. 2.30 p.m.—Battalion Parade.

Parade.

The Acton Range will be open from 2.30 p.m. on Saturday next, the 26th inst., for men who have already given in their names to the Musketry Staff.

A. G. Joiner, Captain and Adjutant.

Electric Cooking.—We are informed by the Hotpoint Electric Heating Co., of 38, Poland Street, Oxford Street, W., that the electric cooker illustrated in fig. 9, on page 871 of our last issue, is their "El Cooko" oven.

Miners' Lamps Approved .- The London Gazette contains a Home Office announcement to the effect that the following Mesers. Patterson & Co.'s safety lamp, type B 8.

The "Rutter" miners' electric safety lamp.

The Oldham "Emergency" electric lamp, type No. 2 (Bull's-eye).

Institution and Lecture Notes.—Electrical Association of Australia.—At the first meeting of the VICTORIAN SECTION, on November 30th, 1914, Mr. W. H. Alabaster was elected President for the ensuing year; Mesers. F. A. McCarly and A. W. Kendall were elected Vice-Presidents, and Mr. E. H. W. Westwood Hom. Secretary. On March 31st the new President delivered his inaugural address, in which he compared the output of electric apply undertakings in Melbourne during the years 1904 and 1914. He stated that the first Federal Council of the Association consisted of the following members:—Mesers. O. W. Brain (president), W. H. Myers, H. B. Forbee Mackay, A. C. F. Webb, H. Payne, W. J. Newbigin, and W. H. Alabaster.

At the March meeting of the New South Walls Section, Mr. W. H. Myers delivered his presidential address dealing with the electrical progress in Australia during the past 12 months.

Illuminating Engineering Society.—At the annual general Institution and Lecture Notes.—Electrical Associa-

Illuminating Engineering Society.—At the annual general meeting on May 18th the report of the Council was presented and adopted. It showed that the international work of the Society had been interrupted by the war, and many of the members were engaged in war work; the membership, however, was slightly higher than before the war broke out, and much useful work had been done. Additional funds were required to carry on the work of the Society in a satisfactory manner, and for this purpose new members were needed.

Accident.—Alfred Nicholson, electrician, Manchester, was working on a ladder at the Radoliffe Paper Co.'s works, James Street, Radcliffe, on Friday last, when he fell and fractured his skull. He was removed to the Bury Infirmary in a serious condition.

The National Physical Laboratory.-The annual meeting of the General Board was held on Tuesday, June 15th, when the annual report and accounts for the year 1914-15 adopted for presentation to the President and Council of the Royal adopted for presentation to the President and Council of the Royal Society, and the programme of work for the coming year sapproved. This year the usual gathering of visitors at Teddington, to meet the members of the General Board and to inspect the Laboratory, will not take place; 25 per cent of the staff are on active service. The report will be dealt with in a later issue,

Appointments Vacant.—Junior shift engineer (£2) for Accrington Electricity Works; charge engineer (30s.), for St. Albans Electricity Works; switchboard attendant (25s.) for Borough of Heywood. Particulars are given in our advertisement pages.

#### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials. - Mr. GILL, electrical engineer at Peterborough, has been ordered by his medical man to take a change of air, and the Town Council have authorised ME. T. ROWLAND to take charge of the works until Mr. Gill's

LIEUT. G. C. MILNES, of the 5th King's Own Royal Lancaster Regiment, has been mentioned for gallantry in the field by Field-Marshal French. Lieut. Milnes is the electrical engineer at Lancaster. He has had charge of the machine gun section which has done splendid work, and a gun was once repaired during heavy fire when the Germans were attacking near Ypres.

Tramway Officials.—Mr. FERGUSSON, manager of the Dartford tramways, who has recovered from a serious operation, has resumed his duties.

-Mr. RAYMOND J. MITCHELL has resigned his General.cicheral.—Mr. RAYMOND J. MITCHELL has resigned his position as commercial engineer to Edison Accumulators, Ltd., which he has held for the last three years, and has taken a position as engineer to Mr. E. Sanger-Shepherd, of 5, 6 and 7, Gray's Inn Passage, Holborn, scientific instrument maker, who has specialised in various fields, including natural colour photography and the telegraphic transmission of photographs.

At the General Post Office, Aberdeen, Mr. W. C. Thompson was appeared with a writing hyper up his retirement from the posi-

presented with a writing bureau on his retirement from the position of assistant superintendent of telegraphs in Aberdeen. Mr. Thompson entered the service of the P.O. as a telegraphist at

Mr. A. D. Leiper, superintendent, presided.

Mr. A. D. Leiper, superintendent, presided.

Mr. ELI MARSDEN is to be recommended for appointment as borough engineer of Darwen, in succession to the late Mr. R. W. Smith-Saville, at a salary of £300 per annum. Mr. Marsden has been with the Corporation 12 years, and served his articles with Mr. Smith-Saville.

DR. W. H. BRAGG, F.R.S., has been appointed to the Quain Chair of Physics tenable at University College, in succession to Prof.

The Highways Committee of the L.C.C. recommends that Mr. D. DAVIES and Mr. H. MARKS be appointed representatives of the

Council on the Electrical Conciliation Board and the Rolling Stock Cenciliation Board respectively, to fill the vacancies caused by the resignations of Lord Alexander Thynne, who is with H.M. Forces, and Mr. Isidore Salmon, also that the deputy chief officer of tramways be appointed on the Electrical Conciliation Board, in the place of Mr. J. Shepherd, the electrical assistant, who has resigned.

who has resigned.

ME. WALTER J. CRIDGE, who joined the Queen's Westminster Rifles in November last, has been gazztted as Second Lieutenant to the Sherwood Foresters (15th Notts. and Derby), his appointment dating from May 31st.

ME. RALPH H. CRIDGE has joined the staff of the British Westing-

MR. RALPH H. OBIDGE has joined the staff of the British Westinghouse Electric and Manufacturing Co., Ltd., Trafford Park, Manchester, in the control gear section.

PRIVATE FRED BOND, of Ashton-on-Ribble, near Preston, an employé of Messrs. Dick, Kerr & Co., has been wounded in the left thigh by shrapnel while serving in France.

We regret to learn that LIEUT. H. L. DOWNES, 8th King's Liverpool Regiment, is reported by the War Office to be missing during the fighting 16th-18th inst. Mr. Downes is a partner in the firm of Downes & Davies, wholesale electrical merchants, of Liverpool and Manchester. He has been connected with the wholesale branch of electrical business for the last nine years, and he has an extensive circle of electrical friends in London and the provinces. According to the Liverpool papers, Lieut. Downes is 32 years of age and unmarried. About three weeks ago he was appointed machine gun officer on the staff of the Brigade to which appointed machine gun officer on the staff of the Brigade to which he was attached. A letter from an officer states that Lieut. Downee's job "was the hottest of all, as he had charge of the bombers and machine guns. He was one of the best soldiers we had. All the men were heroes, and not one of them turned, but on they went, and it was a job to make them come back when we had orders to retire."

Obituary.—HERR EMIL RATHENAU.—The death is reported, from Berlin, of Herr Rathenau, founder and head inspiring genius of the Allgemeine Electricitäts Gesellschaft, at the age of 76 years. The deceased gentleman was born in Germany, and served his apprenticeship in a Silesian foundry. Later he was employed as a draughtsman in the ship engine work. of John Penn, at Greenwich. Upon his return to his native soil he started a small foundry in Berlin, but want of capital brought the enterprise to grief. Press reports say that on this account he cherished throughout life a grudge against the bankers who failed to come to his support. Perhaps that experience had much to do with his subrequent efforts to ensure that complete co-operation. of finance and industry in the development of the vast electrical and other undertakings in Germany and elsewhere in which the A.E.G. was interested. It is stated that his success dated from the A.E.G. was interested. It is stated that his success dated from the year 1881, when he formed the German Edison Co., which in 1887 became the A.E.G. Herr Rathenau is described as one of the most successful business men in Germany, which he did much to bring into the front rank as an industrial country. As would naturally be expected, and as our pages during the last few months have actually shown, the works of the A.E.G. are engaged at high pressure in the manufacture of war requirements for our enemies.

The death occurred on June 16th of MB. T. CHARLTON, manager and chief engineer of the Bishop's Castle (Salop) E.L. Co. Deceased, who had resided in the town for only a year, died in Salop Infirmary from an internal complaint.

MR. JAMES WALMSLEY, chief engineer of the Blackpool Tower, who had complete oversight of the engineering department, including the electricity plant, was found drowned in one of the filter beds connected with the aquarium tanks of the tower on Thursday last week.

Thursday last week.

Thursday last week.

The members of the South African Institute of Electrical Engineers have passed a vote of condolence with the widow and parents of Mr. Joseph Walter Anson, who was connected with the engineering staff of the Corner House, and who recently died in Leeds at the age of 30. Mr. Anson went to the Rand five years ago as electrical assistant to Mr. J. H. Rider, late consulting mechanical and electrical engineer to the Central Mining and Investment Corporation. He left the Rand last January for a six months' health trip.

Will.—It is stated in the Press that the late LIEUT. BRIAN CROSSLEY left £60,213 gross and £47,557 net personalty.

## ELECTRICAL PROGRESS IN SHANGHAI.

The annual report for the year 1914 of Mr. T. H. U. Aldridge, municipal electrical engineer, to the Shanghai Municipal Council, recently came to hand, and shows that the electricity departments is rapidly growing in importance. Apparently the war has had no appreciable effect upon the growth of the demand, and the plant at Riverside station could not be shut demand, and the plant at Riverside station could not be shut down for overhauling; nevertheless, a further large reduction in the generating costs was effected, although a much higher price had to be paid for coal. The consumption of fuel at Fearon Road station averaged 4.57 lb. per unit for the 12 months, whereas at Riverside it was only 2.29 lb., owing to the greater economy of the generating plant. The units sold and accounted for amounted to 32.885.822; the works costs per unit were: coal .306d.; oil, waste, water and stores .024d.; wages

.054d.; repairs and maintenance .153d.; rents, rates and taxes .021d.; management .126d.-total .684d.

.03dd.; repairs and maintenance. 153d.; rents, rates and taxes .02ld.; management. 126d.—total .684d.

Unfortunately the war caused delay in the delivery of the new plant, which should have been in operation by the end of the year. Four new B. & W. boilers were put into service, and one of the 5,000-kw. turbo-generators; part of the other generator, and the new switchgear from the British Westing-house Co. and Messrs. Reyrolle, have not yet arrived in Shanghai, but by temporary expedients the new machine and two of the three new feeders were brought into use. The plant capacity of the two stations is 14,900 kw., not including the second 5,000-kw. set. The maximum load recorded was 11.800 kw., and the load factor attained the high figure of 33.6 per cent., which is much better than in any of the British municipal undertakings—only four in number—which have a larger output than Shanghai. The length of mains was extended by 187 miles, of which 44 were underground. Four large sub-stations, each designed to accommodate 2,000 kw. of plant, were put into service, and the areas of the central district which they serve were converted from single to three-phase supply with satisfactory results. Various other sub-stations were erected on consumers' premises, and the total increase in transformer capacity was 3,579 kw. The street lighting was increased to 108 are and 1,231 metal lamps some half-watt lamps have been installed, and these may later on be substituted for the flame are lamps, as it is very street lighting was increased to 108 arc and 1,231 metal lamps; some half-watt lamps have been installed, and these may later on be substituted for the flame arc lamps, as it is very difficult to get natives to trim the latter properly. The number of meters issued during the year was 2,833 (net), and there was a net increase of 3,968 service connections, making a total of 14,955; the equivalent number of 30-watt lamps connected (excluding public lighting and motors) was increased by 99,626 to 528,747. The radiators connected totalled 871, equivalent to 1,700 km., and 52 electric cookers were in use. The net increase in the motors connected was 6,917 H.P., making a total of 12,181 H.P.; three mills accounted for 4,200 H.P. of the increase. Over 3,000 H.P. additional is expected in 1915.

"Shanghai is now known throughout China and the East generally as a cheap power centre, a fact which, if indications are read aright, points to enormous industrial possibilities for the place."

for the place."
The units sold were 32,885,822, and 4,206,222 were used at works. Excluding the latter, the net increase over the previous year was 63.75 per cent. Private lighting took 12.3 million units, power 15.2 millions, traction 3.6 millions, public lighting 1 million, and heating and cooking 4 million. The staff numbered 79 foreigners and 801 (hinese; 11 members went home to join the Army—others wished to go but could not

be spared.

The net profit for the year was £11,000, and was less than was expected, owing to delay in taking a supply on the part

of two large power consumers.

of two large power consumers.

Although the Riverside power station was opened in April, 1913, to accommodate plant of 14,000 kw., further large extensions are necessary, the increase in the demand for 1915 being estimated at 4,600 kw., and the total increase up to the end of 1917 at 13,600 kw. Mr. Aldridge therefore proposes to install two 10,000-kw. turbo-generators and eight boilers, with the necessary switchgear, etc. Allowing for the removal of some old plant, the total capacity at the end of 1917 will be 37,200 kw., and the capacity less reserve plant, 27,200 kw., to meet an estimated load (excluding traction) of 24,000 kw. Orders for the new plant must be placed at once, as the matter is urgent. While not definitely committing himself to the adoption of a pressure of 33,000 volts for the underground cable transmission from Riverside to Shanghai, a distance of five miles, Mr. Aldridge discusses the advisability of doing so, and cites the example of Manchester under similar conditions. The cost of the extensions contemplated is estimated at 4256,000. at £256,000.

at £256,000.

In a further report the electrical engineer points out that the price of electrical energy in Shanghai compares favourably with the tariffs in force in the four largest municipal undertakings in Great Britain, being 3d. per unit for lighting and 1d. to .75d. for power. The heavy outlay on extensions in the past has never caused the price to be raised, and the amount contributed by the department to aid the rates has increased from year to year. Moreover, the supply of cheap power is aiding the industrial growth of Shanghai, and the use of electricity for heating and cooking is extending. The department for at least 15 years has been entirely self-supporting, paying 6 per cent. interest on debentures and allowing ing, paying 6 per cent, interest on debentures and allowing liberally for depreciation. Owing to the abnormal conditions prevailing in Great Britain, delays in supplying plant are probable, and therefore contracts should be placed as soon

probable, and therefore contracts should be placed as soon as possible.

The accounts of the department show that the receipts for the year were £169.625, and the expenditure, including depreciation, £122,915, leaving a surplus of £46,710. After deducting interest, special depreciation on the Fearon Road plant, etc., and contributing £3,782 to general funds, there remained a net balance of £11,091. The total capital expenditure amounted to £607,198.

Mr. Aldridge was to leave for Home via the United States on May 29th, and expects to be in England towards the middle of July. We understand that his visit is in connection with the new 20,000-kw, extension scheme, which is to be carried out, and he will issue specifications and call for tenders on the lines set out in his report.

#### NEW COMPANIES REGISTERED.

North British Flectrical Co., Ltd. (9,414).—This company was registered in Edinburgh on June 12th, with a capital of £3,000 in £1 shares, to carry on the business indicated by the title, and to adopt an agreement with George Robertson and James Robertson, engineers, both of Paisley, and Joseph B. Tannahill, electrical engineer, of Bellust. The subscribers (with one share each) are: G. Robertson, Snawdoun Works, Paisley, engineer; J. B. Tannahill, 31, Queen Street, Belfast, electrical engineer. Private company. The first directors are G. Robertson, J. Robertson, and J. B. Tannahill. Registered office: 15, New Sneddon Street, Paisley.

London Telephone (New System) Co., Ltd. (9,415).—
This company was registered in Edinburgh on June 14th, with a capital of £10,000 in £1 shares, to carry on the business of making, selling, putting up, maintaining and working, so far as is lawful, private telephones or telegraphs, whether electrical or otherwise. The subscribers (with one share each) are: J. MacMahon, Sheriff Park House, Rutherglen, provision importer; R. Logan, Knocknar, Kilbirnie, school teacher. Private company. The number of directors is not to be less than three or more than seven; the first are C. Cochran, F. T. Jeckson, J. Levy, R. Logan, and J. MacMahon. Qualification, 250 shares. Remuneration for first year, £30; for second, £40; third, £50 pr annum. Registered office: 35, West Regent Street, Glasgow.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

British Battery Co., Ltd.—Second mortgage, dated June 7th, 1915, to secure 2000, charged on all the company's assets, present and future. Holders, A. H. Rose and T. A. Rose, 38 and 39, Beach Street, Barbican, E.C.

Ozonair, Ltd.—Debenture, dated June 5th, 1915, to secure £4,000, charged on the company's undertaking and property, present and tuture, including uncalled capital (if any). Holders: British Electric Traction Co., Ltd., 1, Kingsway, W.C.

South Metropolitan Electric Light & Power Co., Ltd.—Issue on June 9th, 1915, of £25,000 debs., part of a series of which particulars have already been filed.

#### CITY NOTES.

## Imperial Tramways Co., Ltd.

THE directors report as follows for the year ended December,

Middlesbrough, Stockton and Thornaby Electric Tramways.—Gross receipts £63,562, an increase of £3,276. The total number of passengers carried was 12,261,624, an increase of

number of passengers carried was 12,261,624, an increase of 255,098. The net profit for the year was £17,604, as compared with £17,824.

A further length of permanent way has been reconstructed during the year and the cost charged against revenue. The traffic receipts would have shown a much greater increase but for the falling off since war broke out at the beginning of August. The company's services of cars and buses have been maintained with little or no inconvenience to the public, but naturally not without drifticults, owing to the war conditions prevailing on the north-cast coast and to the fact that one-third of the staff have joined H.M. Forces. Special allowances have been granted to the dependents of the men on active service.

London and Suburban Traction Co., Ltd.—This company bolds 122,230 five per cent, cumulative preference shares of £1 each in the London and Suburban Co., and has received the full dividend for the past year on the preference shares of that company and a

and Suburban Co., and has received the full dividend for the past year on the preference shares of that company and a dividend on the ordinary shares at the rate of one per cent, per annum for the half-year to June, 1914. The revenue account of the London and Suburban Co. for 1914, however, showed a balance insufficient to pay a dividend on the ordinary capital in respect of the December half-year.

The company's net revenue account for the year shows an available balance of £31,22, and after payment of interest on the debenture stock for the whole year and dividend on the preference shares, it is proposed to pay a dividend for the year at four per cent, on the ordinary capital (less income tax), carrying forward £314.

tax), carrying forward £314.

The directors report the death of Mr. Hugh G. Doggett, P., a director. Mr. James H. Howell, J.P., of Bristol has J.P., a director. been elected to the board.

## J. G. White & Co., Ltd.

The report for the year ended February 28th, 1915, states that The report for the year ended February 28th, 1919, states that the effect of the war on the business of the company has been very serious. Work in progress has had to be reduced or entirely suspended, and no new contracts are likely to be obtainable under the present adverse conditions. Collections of accounts have in some cases been delayed, as clients have been unable to make financial arrangements. Financial business have been unable to make financial arrangements. profits in the past—has also stopped. The directors have made drastic reductions in expenses. Under the circumstances, the profit earned of £19,773 is not unsatisfactory. Investments have not been re-valued, their valuation having been on so conservative a basis that even with the heavy depreciation in

all securities during the last year, their book value is believed to be below their intrinsic value. They are, however, not readily marketable at the present time, and the company's assets are thus less liquid than is desirable. The cash balance is not far above the amount required for working capital. is not far above the amount required for working capital. The directors, therefore, in spite of the large reserves accumulated, did not feel justified in paying an interim dividend in January last, and are now unable to recommend a dividend above the rate of 6 per cent. on both classes of shares. The balance to the credit of profit and loss, after bringing in £21,786 from the previous account, is £41,559. The dividend of 6 per cent., less tax, on the cum. pref. shares absorbs £9,000, and that of 6 per cent., less income tax, on the ordinary shares £3,000, leaving £29,559 to be carried forward. Annual meeting: June 29th.

### Globe Telegraph and Trust Co., Ltd.

SIR J. WOLFE BARRY, K.C.B., presided on Tuesday over the annual meeting held at Electra House, E.C. Referring to the changes in some of the investments, he said that some of their large holdings had been somewhat reduced and some the changes in some of the investments, he said that some of their large holdings had been correspondingly increased. The total receipts for the 12 months, after deducting the usual working expenses, had amounted to £209.164, a decrease of £609. With regard to the decrease of £609 in the receipts, that was partly due to the increased income tax deducted from some of their dividends and partly to the fact that some of the proceeds resulting from the paying off of the Submarine Trust certificates had not yet been re-invested. Certain changes had taken place in their investments. The Cuba Submarine and Telegraph Company, which for some years past had paid a dividend of 6 per cent., had reduced its dividend to 5 per cent., showing a loss of £12. On the other hand, the Great Northern Telegraph Company had increased its dividend from 20 to 22 per cent., resulting in a gain of £182. There were also increases in the dividends received from the Indo-European Telegraph Company of £167; the Telegraph Construction and Maintenance Company, of £696, and the Western Union Telegraph Company of these companies was the result of shares purchased more than 12 months ago, from which they had not received the full dividends when the accounts were closed last year, whilst the addition from the Western Union Telegraph Company was due to the increase of the rate of dividend which they were paying from 3 to 4 per cent. The net result was that they were continuing to pay 6 per cent. to their ordinary shareholders and to carry forward a balance of £27,655, as compared with £25,723 at this time last year. The present market value of the securities held by the company, taking the lowest present market price, showed a surplus over the original capital of £220,575.

Sir James Pender, Bart., seconded the motion, which was carried.

#### Rand Mines Power Supply Co.

Mr. Bernard Price presided at the annual meeting recently MR. BERNARD PRICE presided at the annual meeting recently bold in Johannesburg. After referring to the resignation of the office of chairman by Mr. F. D. P. Chaplin on his appointment as Administrator of Southern Rhodesia, and to the absence of Major Bagot on military service in Europe, he said that the results for the year under review were thoroughly satisfactory, especially considering the dislocation which might have been caused by the succession of exceptional circumstances commencing with the strike in January, 1914, followed by the outbreak of the European war, the rebellion in that country, and hostilities in German South-West Africa. that country, and hostilities in German South-West Africa. As a result of the prompt and effective measures taken by the Union Government, the January strike did not influence the business of the company to any appreciable extent. The military operations in the country resulted in an acute shortage of railway trucks for coal traffic and withdrew, for military age of railway trucks for coal traille and withdrew, for military duty, a considerable number of employés from the staff of the company which managed the concern, but the continuance of the mining industry in full operation prevented any appreciable reduction in the power requirements of consumers. During the year 1914, it became possible, for the first time, to settle down to steady and efficient working. In earlier years every effort had to be centred upon meeting the urgent and extensive initial requirements of consumers, and it was not until these requirements had been satisfied that the full complement of spare plant could be installed. Now that the full guaranteed percentage of reserve plant had been provided and most of the initial difficulties, inseparable from the rapid development of such a large business, had been satisfactorily overcome, the conditions of working had become much more uniform, and it had been possible to give attention to the economical and efficient operation of all departments of routine work. The capacity of electric generating and air compressing plant now installed and being installed was sufficient to provide somewhat more than the guaranteed margin years every effort had to be centred upon meeting the urgent cient to provide somewhat more than the guaranteed margin in reserve for each type of supply, and consequently it should be possible, with relatively small additional expenditure, to meet such further increases in requirements of consumers as were likely to be requisitioned for some time to come.

### Aluminium Corporation, Ltd.

MR. KENNETH M. CLARK, presiding at the annual meeting held on June 17th, at the Great Eastern Hotel, E.C., said held on June 17th, at the Great Eastern Hotel, E.C., said that the first mortgage debenture stock had been increased from £50,000 to £150,000. This was one of the benefits obtained by the exact defining of the value of the participating shares. The chief difficulty at Dolgarrog since the inception of the company had been the limited amount of water-power available. Had they been able to bring all the water obtainable on their watersheds into use, their profits both last year and the year before would have been very considerably increased. It was absolutely essential, if they were to bring the company to a really successful position, that the output of metal should be increased, and this could only be done by additions to their inclinate. That they been very considerably increased, it was absolutely essential, if they were to bring the company to a really successful position, that the output of metal should be increased, and this could only be done by additions to their water-power. They had remedied the difficulties in connection with the carbon works by removing these from Wallsend to Dolgarrog, and had now got the works organised in such a manner that they produced a very much larger output. Last year he told them that work had been commenced upon the tunnel to bring the Dulyn water into the Eigiau Lake, and the directors very much regretted that the failure of the contractor to carry out the terms of his contract had deprived the company of the possibility of obtaining some benefit from this water during the present financial year. Money was needed for carrying on this work, and he had, therefore, added to his interest in the company by taking a further \$215,000 of the first debentures. Although this water would considerably add to their output they would, on completion of the tunnel, be faced with the fact that a large amount of water was going to waste because the lake was not large enough. It was, therefore, with a view to providing another dam and a second pipe line that these debentures had been created, and they proposed, before placing these in other quarters, to give the present debenture holders and shareholders the opportunity of taking them up. Trading profits showed an increase of over £2,000 above 1913, and this figure had only been prevented from being a much larger one by the fact that it was impossible to manufacture any more metal for want of water power. The special expenditure on the Bauxite Refining Co. had been unavoidable, and to a considerable extent caused by the war. The item for special litigation was in consequence of a claim by Mr. Robertson Lawson, which the directors felt it their duty to contest, and in regard to which the legal authorities gave their decision against the company. The preference divi

the balance of £3,286.

Mr. Abthur F. Bort seconded the resolution, which was carried unanimously.

## Birmingham District Power & Traction Co., Ltd.

The annual meeting was held on Monday at Electrical Federation Offices, Kingsway, Mr. C. S. B. Hilton presiding. The Charron said that there had been no addition to the capital account during the year, but the account had been credited with £12.193, the proceeds of the sale of certain omnibuses to the Birmingham & Midland Motor Omnibus Co. During the year £7,268 debenture stock was purchased and cancelled at a cost of £6.185. The item of sundry debtors showed a reduction of £11.700. Loans stood at a high figure, but it had been necessary to make advances to the Shropshire, Worcestershire & Staffordshire Electric Power Co., and the Birmingham & Midland Motor Omnibus Co. to enable those companies to meet commitments contracted before the war

broke out for absolutely necessary extensions of their business. All expenditure was carefully scrutinised. The same amount had been credited to renewals account as in previous years. The heavy expenditure on that account last year was due to renewals falling due. £2,000 had been added to the reserve, bringing that fund up to £16,493, so that the total reserves amounted to the respectable figure of £67,000. The traffic receipts showed a decrease for the year of £790. Expenses showed a decrease of £470. As a result, the amount available for appropriation, after placing £4,000 to renewals, was £51,845, compared with £58,367 in the previous year; but the interest payable on loans was £8,750 less, owing to the loan from the Shropshire Co. having been repaid by the sale of the Smethwick Electric Supply undertaking to that company. The available balance, therefore, was £1,500 more, but the debenture sinking fund required £760 more, and after paying the same dividend on the preference shares and on the preferred ordinary shares, and placing the same amount to reserve as in 1913, there was an addition to the carry forward of £700. Having regard to the effect of the war on the tramways during the latter half of the year, the net results of the company's trading for the year might be considered satisfactory. The total revenue from their investments was £38,185, compared with £30,849; an improvement of £7,336. That represented a return of 3.71 per cent, on the cost of the company's investments compared with 3.05 per cent in 1913 factory. The total revenue from their investments was £38,189, compared with £30,849; an improvement of £7,336. That represented a return of 3.71 per cent, on the cost of the company's investments, compared with 3.05 per cent. in 1913. The increase of £7,400 in dividends was accounted for partly by the dividend on the deferred ordinary shares in the Electrical & Industrial Investment Co. and partly by the dividend received for the first time for some years on the company's received for the first time for some years on the company's holding in the preference shares of the South Staffordshire received for the first time for some years on the company's holding in the preference shares of the South Staffordshire Tramways (Lessee) Co.; and the first dividend on the preference shares held in the Birmingham & Midland Motor Omnibus Co. In the case of the latter company, the shareholders had cancelled the arrears of dividend on the preference shares, and a dividend of 5 per cent. was declared and paid for 1914. The rate had been increased from 5 per cent. to 6 per cent., and it was believed that that would be regularly paid in future. The South Staffordshire Tramways (Lessee) Co. had also cancelled all arrears of preference dividend and increased the rate of dividend to 7 per cent., and he hoped that in future the company would pay dividends on the preference shares regularly. The Dudley, Stourbridge & District Electric Traction Co. was compelled to reduce its dividend from 4 per cent. to 1 per cent., a direct result of the war. The Shropshire Power Co. had made good progress and paid the same dividend as in 1913, after placing £4,000 to reserve, against which no such proyision was made in 1913; and it had increased the carry forward by a small sum. The company had obtained the sanction of the Treasury to raise further capital to the extent of £150,000, either by way of debentures or preference shares, and negotiations, in which they, as the largest above holders. to the extent of £150,000, either by way of debentures or pre-ference shares, and negotiations, in which they, as the largest shareholders, were taking part, were now taking place wise a view to obtaining that capital, which had every promise of materialising. On the outbreak of the war a mutual aid fund was promoted by the different companies for giving financial assistance to the dependents of employés who had enlisted. That fund had already done much useful work and was much appreciated by the men. 39 men had joined the Colours, and it was becoming more and more difficult to carry on the work. appreciated by the men. 39 men had joined the Colours, and it was becoming more and more difficult to carry on the work. It was a matter for satisfaction that during the year no serious labour troubles had occurred. In addition to their subscription to the mutual aid fund, they were paying a war bonus to all their employés to meet the increased cost of living. Owing to the shortage of men, an experiment was tried of training women as conductors, but it did not meet with the success it deserved owing to some opposition from the men, and it had to be abandoned. He was convinced, however, that it would shortly be revived, as week by week the drain of men became more and more acute.

Mr. J. A. Lycert seconded the motion, which was carried unanimously.

unanimously.

A Swiss Issue.—The Columbus Electrical Undertaking A SWISS ISSUE.—The Columbus Electrics: Chackwarm, or the was formed a few years ago as an investment company at Glarus, and is associated with the Brown-Boveri group, has decided to make a loan issue of £400,000 in 6 per cent, bonds, to provide further working capital, and one-half of the amount is now being offered for subscription in Switzerland. At present the company, which has a paid-up ordinary share capital of £680,000, owns 75 per cent. of the share capital of the Compagnia Italo-Argentina de Electricidad, of Buenos Ayres, which holds a concession similar to that of the German Transmarine Electricity Co. in Buenos Ayres, and already has private, municipal and State contracts, which ensure an annual income of £240,000. The Italo-Argentina company also holds the whole of the shares in electrical undertakings in the provincial towns of Dolores, Corrientes and

Manila Electric Railroad and Lighting Corporamainta Electric Mairoad and Lighting Corpora-tion.—The report for 1914 states that the gross earnings were \$1,602,001, a decrease of \$96,592; operating expenses and taxes increased \$27.628, while the net earnings from operation were \$783.586, a decrease of \$124,220. Four dividends of 1½ per cent. making 7 per cent, for the year, were paid. Of the decrease of \$96,592 in the total gross earnings, \$92,000 occurred in the rail-way department. The electricity department earnings fell \$9,000, the balance being caused by the closing-down of the trucking department. department.

Greenwood & Batley, Ltd.—The report for the year mded March 31st states that, after providing for interest on the debentures, expenses of management and doubtful debts, the accounts show a profit of £68,395, and the balance at credit of profit and loss at March 31st, 1914, £4,825, makes £78,220. The directors have appropriated £28,000 for depreciation and £10,000 to reserve account, and they recommend a dividend of 12½ per cent. per annum on the paid up ordinary share capital, leaving £6,418 to be carried forward.—Financial Times.

Puebla Tramway, Light and Power Co.—The payment on July 1st of coupon No. 8, due that date, on its prior lien gold bond issue, which issue ranks in all respects prior to the first mortgage bonds, is announced, but owing to the conditions existing in Maxico the coupon, No. 17, due the same date, on the first mortgage bonds, cannot be paid. It is stated in the Press that a meeting of the first mortgage bond-holders will be held as early as possible in July to consider a funding scheme in connection with their bonds.

Credenda Conduits, Ltd.—The report for the year ended April 30th shows that the profit, after providing for repairs, depreciation, directors' fees, and reserve for income-tax, amounts to \$5,147, which, with \$714 brought forward, gives an available balance of £5,862. The directors have written £1,000 off the goodwill account, and they recommend a dividend at the rate of 8 per cent. per annum, free of income-tax, on the ordinary shares, carrying forward £862—Financial Times.

Stock Exchange Notice.—Application has been made to the Committee to allow the following securities to be quoted in the Official List :-

Electro Bleach and By-Products, Ltd.—112,044 7 per cent. participating preference shares of £1 each, fully paid, Nos. 1 to 112,044.2

Winnipeg Electric Railway Co.—Dividend  $2\frac{1}{2}$  per cent. for the quarter to June 30th, being at the rate of 10 per cent. per annum on the fully paid up capital stock.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—Interim dividend for the quarter to March 31st of 2s. 6d. per share, free of income-tax.

Eastern Telegraph ('o., Ltd.—First quarterly interim dividend of 11 per cent. on ordinary stock, free of income-tax. (o)

## STOCKS AND SHARES.

Publication of the prospectus of the new War Loan has had the useful effect of putting an end to the suspense which its advent had caused to act as a damper upon every market in the Stock Exchange. The new loan was bound to come into competition with existing issues, to the natural detriment of the latter, but we are all of us getting so accustomed by this time to be told that we must not mind enduring such little hardships, for the sake of winning the war, that nobody grumbles. Possibly there may be selling of some of the older securities, in order that the money may be freed for the taking up of the new loan; and this for a time will have a heavy effect upon prices. There is much relief felt, however, at the knowledge that no fresh public borrowing is likely to be required for some time to come; and, in spite of all official warnings, there are those in the Stock Exchange who declare their confidence in the end of the war being reached before the money raised by the present loan shall have become exhausted. the useful effect of putting an end to the suspense which its exhausted.

exhausted.

With so much attention fixed upon the newcomer, it is scarcely likely that other securities can command an increase of public interest. The general tendency is still disposed towards duffness—due, of course, to the War Loan, as noticed before, and also to the idea that, were Lemberg to fall, the consequences to our Russian allies would prove unpleasant for the time being, although the advantage could scarcely be anything but temperary to the Gormans.

the time being, although the advantage could scarcely be anything but temporary to the Germans.

The Electric Lighting market holds its own with a good deal of firmness. For some shares there is insistent demand. On the other hand, the remaining sections with which we deal mostly lean to the lower side, and the quietude of business is in itself a cause for the sagging away of prices here and there. Home Railway stocks are decidedly on the down grade. The Steam issues have dropped abruptly, and, in sympathy, those of the Tube companies are also lower, although not to any great extent. Underground Electric Incomes shed 1½, because there is still something of a speculative account left in them. The shilling shares were called nominally 5s, the other day, though the price was a trifle optimistic; actually, at the day, though the price was a trifle optimistic; actually, at the present time, it is 4s. 6d. middle. The staffing of the various stations on the Tube lines with women is rapidly growing. and admiration of the way in which the young ladies perform their duties is in no wise diminished by the pardonable curiosity occasionally displayed by an "officiallass" more interested in some happening in the street than in the clipping

of tickets.

Brazil Tractions continue to move in volatile fashion—

actuated chiefly by the vagaries of the fluctuations in the Rio rate of exchange. Within the past week the price has been up to 53 and down to 51, with a good deal of business (in small lots) taking place day by day. The Mexican division marks time, holding its recovery of a fortnight ago, but not sufficiently supported by fresh buying orders to make a further forward movement. Mexico Tramways common shares were done the other day at 33; and the 5 per cent. first mortgage bonds of the Mexican Light & Power Co. are changing hands occasionally on the basis of 25—a fall of 55 points in the less than twelve months. Mexican Electric Light 5 per cent. first mortgage bonds are quoted at about the same price as those of the Light & Power Co., and can be dealt in on a similar basis. From which it is manifest that quotations are slightly less nominal than they have been until just lately.

The Anglo-Argentine Tramways group is steady, with inquiries for the 4 per cent. debenture stock, and a little business is doing, too, in the first preference shares, the yield on which comes to 6½ per cent. Bombay Electric debenture stock has again risen a point, and other descriptions in the foreign market are very firm.

The Madras Electric Supply Corporation turned its deficiency of £5,300 in 1913 into a profit of £300, but as the sinking fund came into operation for the first time last year, and the company also received less interest, the net result for the year was a loss of £11,700. The present debit balance is £43,000. The company, however, is now equipped with new plant, so that it ought to be able to develop on more progressive lines than has hitherto been possible. The £5 ordinary shares, which stood at 30s, when war broke out, have not changed hands since the Stock Exchange re-opened last January.

The Imperial Tramways Co. shows that, to maintain the

changed hands since the state.

January.

The Imperial Tramways Co. shows that, to maintain the ordinary dividend at 4 per cent., £2,000 had to be taken from the dividend equalisation fund. Expenses advanced faster than takings, but the net profit of £17,600 is only £200 less than that of the previous year. The company, of course, received no dividend on its holding of ordinary shares in the London & Suburban Traction Co. in respect of 1914. British Electric Tractions hold the advances which they recently made on the dividend announcement and report.

Flectric Tractions hold the advances which they recently made on the dividend announcement and report.

Lively dealings have sprung up within the last few days in the shares of the Colombia Gas & Electric Co., which have hitherto been stagnating at about 10 for the \$100 shares. The price jumped to 14½ on the announcement that a deal has been practically closed whereby the Colombia Co. secures control of the United Fuel Gas Co.; but the advance brought in sellers, and the price reacted to 12½.

Electric Constructions have been good at 13s. 6d., and there was a rush of small orders early this week. The shares seem to have become suddenly popular with a comparatively wide circle of small investors. British Aluminiums hardened to 22s., though the preference are a shade easier at 18s. 3d. London has been a seller of the latter, while support was forthcoming for them from the North. India Rubber shares eased off to 8½ and British Insulated to 11. Other Manufacturing shares are quietly steady.

forthcoming for them from the North. India Rubber shares eased off to 8½ and British Insulated to 11. Other Manufacturing shares are quietly steady.

The Telegraph group is generally easier. Some idea can be gathered of the limited character of investment markets by the fact that the sale of a few hundred pounds sufficed to put down Eastern Extension 4 per cent. debenture stock some 3½ points. The price hitherto had been 91—fairly high, of course, considering the yield obtainable from Trustee securities. Industrial debenture stocks are now likely to move on to a lower plane of price all round, in consequence of the competition of the War Loan. Investors who were content to buy unimpeachable stocks in the industrial companies to yield 4½ to 5 per cent. will probably elect to pass by such issues in favour of the national loan. Patriotism and 4½ per cent. form a tempting pair; and although the price of the loan may go to a premium, the effect upon issues all round cannot fail to make itself felt for a long time.

Anglo-Americans are easier, after their recent rises; and falls have occurred in Globe preference. Western ordinary and Eastern Extension shares. Marconis slipped back a little, and the prices of the subsidiaries are scarcely so firm as they were. It may be recalled that, in their circular of three months ago, the Marconi directors stated that the works and all the companies of flexible them the subsidiaries are stated that the works and all the companies of flexible them them the bisheast reconstructions.

the Marconi directors stated that the works and all the company's staff have been working under the highest pressure throughout the period of the war, although the company's business had been necessarily disturbed. In consequence of a number of matters being in abeyance at that time, the board a number of matters being in aneyance at that time, the board were unable to estimate with sufficient reliability the results of the business of last year to warrant them at that moment in declaring an interim dividend upon the ordinary shares. Therefore, the next dividend announcement, when it comes, will be in respect of the full twelve months.

The rubber market is one of the firmest in the Stock Endeager. Parisage entities entitled in write of the

The rubber market is one of the firmest in the Stock Exchange. Business continues animated, in spite of the quietude prevailing in other sections. Prices are well maintained, in consonance with the quotation for the raw product. Buyers still predominate, and in many of the higher-priced shares there is not sufficient supply to go round. The Armament group is inclined to be easier, and such shares as Birmingham Small Arms and Kynochs reacted somewhat sharply. For the time being, this section is a little out of favour. Not so, however, that for Copper shares, which continue to rise steadily, the improvement being more marked in the case of the lower-priced descriptions than in that for the heavier shares.

The Russian A.E.G., of Petrograd, show gross profits of £392,000 for 1904, as compared with £342,000 in the previous year. After deducting interest on loans and defraying general expenses amounting to £178,000, as against £159,000 in 1913, there remain net profits of £206,000, as contrasted with £155,000. It is proposed to pay a dividend of 10 per cent. on share capital of £1,200,000, as compared with 9'4 per cent. in 1913, but the payment on shares in German hands is reserved until the conclusion of peace. The report of the directors regards the results as favourable, although the turnover decreased by 10 per cent. over the preceding year, and difficulties were experienced in securing delivery of coal and other raw materials. The orders now on hand already exceed the total turnover obtained in 1914, and with the object of manufacturing articles which have hitherto been imported, it is mentioned that the company has entered into close relations with mentioned that the company has entered into close relations with the General Electric Co., of the United States, and the British Thomson-Houston Co., in London.

#### EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING MAY, 1915.

THE returns of electrical export and import business for the month of May show, as regards the former, a slight falling-off, and for the latter, a considerable increase on the April totals. Thus the exports for May amounted to £380,159, as compared with £382,810 in the previous month, while the imports reached Thus the exports for May amounted to £380,159, as compared with £382,610 in the previous month, while the imports reached £268,848, as against £230,752 in April. The re-exports for May amounted to £13,299, as compared with £11,167 in April, showing a slight increase. During the month electrical machinery exports reached a total of nearly £155,000, or a little more than in April, while cable exports showed a considerable advance. Telegraphic and telephonic business fell away, however, and the total result was a decrease of some £2,000 compared with the April export figures.

As regards the imports, it will be noticed that the considerable increase in business in May was due entirely to Continental activity, as American imports reached practically the same value—

E184,000—in the last two months.

The bulk of the increased import business represented machinery and telegraphic and telephonic material, and it is interesting to note that Swiss machinery imports into this country reached the high value of over £30,000.

India was, as usual, our best customer for electrical material; our ally, France, made substantial purchases, as also did Holland and Norway, amongst European countries; while the Australian market was a good one during the month.

Note.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third column contains many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

#### IMPORT TRADE OF PERU.

THE following statement showing the imports of electrical and similar goods into Peru during the year 1913 is extracted from the recently issued trade statistics. Detailed figures for 1912 are not available, but the total values of the various classes are given for purposes of comparison.

	Machinery other than agricultural or printing machines.		Spare parts for machines of all kinds.	Pumps for irriga- tion or mining.	Steam boilers.	Trans- mission belting.	Railway and tramway cars.	Coal.	Rails and acces- sories.	Scientific Anstru- ments.	Telegraph and telephone instruments and apparatus.	cable.	Incan- descent lamps.

## INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION.

On Thursday and Friday, last week, the members of the above Association foregathered at the Institution of Electrical Engineers, London, where the annual meeting was held instead of at Dundee as previously intended.

Naturally the proceedings were overshadowed by the national crisis through which the country is passing, and many familiar faces were missing, including, of course, that of the President, Major Richardson, of Dundee, whose military duties precluded his attendance, and whose place was ably filled by Mr. A. C. Cramb (Croydon) as Acting President.

Under the circumstances the annual convention, to which we have all become accustomed, was dispensed with, but as it was necessary under the articles of association to have an annual meeting, it was decided to arrange a two-days' programme confined more or less to urgent matters of business.

This included reports on "The practical result of the Point Five tariff," by Messrs. A. S. Blackman (Sunderland) and T. Roles (Bradford), and on "The use of electric vehicles in municipal service," by Mr. F. Ayton (Ipswich), both of which were discussed at some length; also the annual report of the Council and election of officers for the ensuing year.

Other features were a parade of electric vehicles following the afternoon's discussion on the subject, and an unofficial meeting of the Point Five Association in the evening, where, in the congenial atmosphere of Tricity House, the temporarily depressing influence of the morning's discussion on the Point Five tariff was dispelled.

It is a matter for regret that the discussion on Messrs. Roles and Blackman's report should have miscarried, as it certainly did; most of the speakers—even some of the devotees of the Point Five Association, who, however, may have taken the matter for granted—avoided marked reference to the essential feature of this tariff—the offering of a rate not exceeding ½d. per unit for the furthering of domestic heating and cooking—and addressed themselves to discussing the weak points of the rateable value system of assessing the primary charge which, being that with which the authors were best acquainted, was perhaps unduly emphasised in the reports. Thus an excellent opportunity was missed of convincing the sceptics, who still appear to be numerous, of the utility of the ½d. rate.

No one, so far as we are aware, has claimed that the rateable value method of assessing the primary charge is suitable under all conditions—for the matter of that, no tariff ever is—and its irregularities do not appear to be more serious than in the case of other tariffs based on floor area measurements. or watts installed. The tariff maker cannot get away from approximations and there is a good deal to be said for a tariff which, despite its imperfections, attracts the consumer, if it leads to legitimate business.

The electric vehicle discussion revealed considerable interest in the question of municipal use of the "electric," particularly for refuse collection for which purpose it shows an undoubted saving. Several speakers referred to the excessive first cost of the electric vehicle, which, as we pointed out in these columns at the time, attracted a good deal of attention at the annual convention of the Electric Vehicle Association of America last year, and we were glad to hear a seller of these vehicles candidly agree that the price is too heavy and that his firm put much more work into their petrol cars costing less money.

If this statement indicates a disposition to drop prices in order to stimulate the demand, rather than wait for the demand to stimulate the discount, it is so much to the good. The plan adopted by the Hampstead Electricity Committee, of purchasing an electric vehicle and hiring it out to the Works Committee, in order to get over the difficulty of first cost, is worth noting; we believe it is being considered in other directions.

Of the vehicles shown at the parade on the Embankment, those of the business type are mostly familiar to our readers, having been described in our pages from time to time; several excellent examples of passenger-carrying electric were also shown, including an Edison Limousine, of handsome design, having a 50-60 mile range on one charge, which is not included in the tabulated list of vehicles on view.

At the business meeting held on the Friday morning, the annual report of the Council was passed with remarkable celerity; we hope to deal with it at length in our next issue.

Mr. Chattock urged the necessity of giving financial support to the work of the Engineering Standards Committee; Mr. Faraday Proctor mentioned that a representative deputation of engineers had waylaid the Treasury with a view to facilitating municipal loans, but without result; and both report and balance-sheet were adopted, as also were the reports of the Development and Electric Vehicle Committees.

The Officers and Council elected for the year 1915-16 are as follows:—

President: *A. C. Cramb, Croydon. Senior Vice-President: *F. M. Long, Norwich. Junior Vice-President: *A. H. Seabrook, St. Marylebone. Past Presidents: G. Wilkinson, Harrogate; R. A. Chattock, Birmingham; H. Richardson, Dundee. Hon. Solicitor: *Ald. C. Pearson, Bristol. Hon. Sec.:

[†] Includes the items in the three preceding columns.

Largely Australian.

Hon. Treasurer: *H. Faraday Proctor, Bristol. *I. E. Edgcome, Kingston-upon-Thames.

*J. E. Edgcome, Kingston-upon-Thames.

Members of Council—Engineers: J. W. Beauchamp, West Ham; A. S. Blackman, Sunderland; S. E. Fedden, Sheffield; T. Roles, Bradford; W. A. Vignoles, Grimsby; W. Wyld, Hampstead; *S. E. Britton, Chester; *W. W. Lackie, Glasgow; *S. L. Pearce, Manchester. Committee Representatives: Councillor Crowther, Sheffield; Ald. Ellaway, Birmingham; Ald. J. P. Smith, Barrow-in-Furness; Bailie W. B. Smith, Glasgow; *Councillor H. R. Barge, Poplar; *Ald. Sir J. Beecham, St. Helens.

Some discussion took place as to where the next annual meeting should be held, and it was agreed to leave this matter to the Council, Mr. Faraday Proctor expressing a hope that it would be anywhere but London, as meetings in the metropolis were always rather a failure.

A resolution was carried that the Government should hold itself responsible for damage done to the plant of electric suppliers through the war. It was pointed out that the Government held itself responsible for damage to real property, but not for damage to goods inside belonging to the tenant; Ald. Smith (Liverpool) dissented from the popular view, urging that people should be prepared to take their own

BAILIE SMITH (Glasgow) gave a brief account of the work of the Parliamentary deputation on coal supplies, from which it appeared that good results are anticipated in the near future, and the proceedings closed with votes of thanks to the Acting President (Mr. Cramb), the Hon. Officers, and the Council of the Institution of Electrical Engineers.

#### The Practical Result of the Point Five Tariff.

The report on the above subject by Messrs. A. S. Blackman (Sunderland) and T. Roles (Bradford), of which an abstract appeared in our last issue, was subsequently discussed at

(Sunderland) and T. Roles (Bradford), of which an abstract appeared in our last issue, was subsequently discussed at length.

Mr. Blackman added as an estimate of supplying a Point Five consumer in Sunderland, with a diversity factor of 5, financial charges of 12s. 11d. per Kw. per annum (works plant 1s. 54d., H.T. feeders, etc. 1s. 2d., L.T. feeders, etc. 16s. 4d.); including working costs, the total came to about 1d. per unit. He felt that although 1d. per unit was satisfactory for cooking purposes, it was no good for heating, which required a rate of about 1d. per unit., and the question was how this rate was to be introduced in the future.

Mr. Gro. Wilkinson (Harrogate) said he felt that the authors had not accomplished the object which they set out to do. It was important to find out the real truth. The two examples were instances of towns where the residence revenue was quite small compared with the total revenue, and in both cases it appeared that by comparison a reduced revenue had been obtained with a greatly increased output as a result of the Point Five tariff; the question was what would happen in a purely residential town? Fortunately the statistics showed better results. At Harrogate they analysed 900 accounts, showing a revenue of £5,700 on the 6d. and 2d. rate. Taking the Point Five tariff; they found the revenue increased to £7,500, and allowing £500 deduction for excess rating of grounds, the result was an increase of £1,300. Reduced revenue from a Point Five consumer could be got over by making it a condition that certain apparatus should be installed. Great harm had been done by using small radiators, but the 3-kw. size might be expensive with an extravagant servant. He agreed that people could not be expected to pay 3d, per unit. for water heating, and there was no reason for it, as apparatus was available which would give an adequate supply of hot water all day at small cost. Allowing 12 units a day at 3d. per unit (100 per cent. L.F.), the cost came out at 4d. It was necessary to take in

the work than the existing gas supply gave in order to justify the expenditure. He was satisfied difficulties would arise in pressure regulation. He discussed at some length the tabulated data in the report, and pointed out that the average revenue was in nearly all cases small, the exception being Marylebone, where the fixed charge was based on plant installed, and not on rateable value. He disagreed with the rateable value assessment, as it produced such a discrepancy in accounts for similar sized houses if one had a garden, and this caused trouble in a small town. A charge based on the kw. demand was the most equitable and, in his opinion, could be understood by consumers. Discrimination between domestic and shop use would lead to a residential shop having two tariffs and cause trouble.

be understood by consumers. Discrimination between domestic and shop use would lead to a residential shop having two tariffs and cause trouble.

Mr. C. H. Wordingham referred to the introduction of the Hopkinson system in 1893, and its re-discovery in later times. Its most modern and worst mutilated forms were due to the "Point Fives." He asked what was a Point Five tariff: only at Luton was id. per unit really charged. He disagreed entirely with the rateable value assessment for charging; it was wrong from the supplier's point of view. Directly it was applied in practice it was hedged round by restrictions and conditions. A consumer with a very bad load factor might be charged above the legal rate. The ground area was a difficulty, and the system was wrong which increased consumption and decreased revenue. The rateable value assessment ignored maximum demand, and he thought they must make up their minds to have a fixed charge per kw., plus a charge per unit. He did not believe for one moment they could economically heat water as suggested by Mr. Wilkinson, and disagreed with the authors' remarks on radiators, as the aim should be to keep the air cool and heat the individual.

Mr. W. Lackie (Glasgow) said they had a special tariff under which, for instance, a house of £40 rental was charged with 200 units at 3d. each, and all units in excess were charged at \$d. a unit. Such a consumer paid on the average of 1.5d. per unit: in his. the speaker's, house the average price worked

with 200 units at 3d. each, and all units in excess were charged at \( \frac{1}{2} \)d. a unit. Such a consumer paid on the average of 1.5d. per unit; in his, the speaker's, house the average price worked out at 1.2d. per unit. There were 2,300 such consumers, and they took 500,000 additional units. A large block of tenement buildings had been erected in the city by an enterprising builder, and each had 12 kw. of plant installed for lighting, heating, and cooking. The builder, who occupied one house, used 16,000 units in a year, costing .77d. a unit on the special tariff, and he dispensed with his servant; the other occupiers used about 10,000 units each. The ratio of lamps to maximum demand was 1 to 6 in large Glasgow tenements, without cooking, etc. Personally, he used a separate boiler for water heating, which cost \( \frac{1}{2} \)5 a year, but at \( \frac{1}{2} \)d. per unit it would have cost him \( \frac{1}{2} \)11.

Mr. BLACKMAN here pointed out that it was a mistake to say that the average revenue had decreased—it had increased, as

Mr. Blackman here pointed out that it was a mistake to say that the average revenue had decreased—it had increased, as shown in the report, at both Bradford and Sunderland.

Mr. Bowden (Poplar) agreed that the Point Five tariff was perfectly right, but joined issue as to the assessment and method by which it was arrived at. The Hopkinson system was used at Poplar, and was described fully in his paper at the last convention. It was a weak point in the rateable value assessment that another department fixed the primary charge for electricity supply. In Poplar they sold in 1910 9 million units at 1.2d. per unit, and with a works cost of .65d. per unit; in 1914, 16 million units were sold at .97d. per unit, with works costs amounting to .55d. per unit. The profits of the two years were £6.700 and £8.000 respectively, and this year, on 17 million units, they anticipated a profit of £14.700. The hiring-out of fans, heaters, etc., was a necessity, and his Council had devoted certain money to providing apparatus to be lent to consumers in order to introduce the system. The future would, no doubt, bring small ½-watt lamps, and therefore a fixed charge was essential in order to lessen the posfore a fixed charge was essential in order to lessen the possible loss of revenue. They must use a large service for a large cooker and charge for it, as also for management, etc.

Baille Stevenson (Edinburgh) said that in the cases cited, if the increased units meant more load at one time, it meant more plant in the station, which was the point which appealed

Ald. Smith (Barrow) said he concluded that large houses on the outskirts would be the first to adopt electric cooking and be the worst to supply. The medium-size houses were wanted, as their position and load factor were better, and that type of consumer directly appreciated the advantages, whereas in whereas large houses the owner had nothing to do with the cooking

Mr. R. A. CHATTOCK (Birmingham) said special tariffs were necessary to attract new business. In an industrial town, lighting was a by-product, and it might pay them to attract it, while it would be no good in a residential town. This led him to the point he wished to emphasise, i.e., that all such supplies should be centralised to get the advantage of the diversity factor over a wide area; in fact to supply on national

Mr. Cooke (Luton) disagreed with the rateable value assess-Mr. Cooke (Luton) disagreed with the rateable value assessment, which had nothing to do with the electricity consumer. In his town they had a simple flat \(\frac{1}{2}\)d. rate for heating and cooking, and he did not think it would stand a higher charge. The only sound basis for fixing the charge was the Hopkinson method, and it could be adapted as desired. The rateable value system did not apply to shops, but in Luton they had sold half a million units for heating, etc., to shops and houses, about 185,000 to the latter. Last year 85 per cent. of their increased output was due to units sold at and under \(\frac{1}{2}\)d. per unit, and the gross profit had gone up at the same rate as the gross revenue. It was absolutely essential to hire out apparatus, as the medium-sized houses were going to be the

apparatus, as the medium-sized houses were going to be the revenue producers.

Councillor Crowther (Sheffield) supported the rateable value method of assessment because it was simple and easily understood. For large houses the average cost of energy was higher than for small ones in Sheffield under this tariff. If they had the courage to introduce a 2d. flat rate it would bring more consumers than the rateable value system.

Mr. Nichols Moore (Newport) did not agree that progress in cooking supply, etc., was restricted to those towns using a Point Five tariff; towns which charged up to 1d. a unit were making great progress. He thought it was evident the users of the system did not know exactly how it should be applied or modified; a point in its favour was the single service and meter. It was a financial question, and if the gross profit showed a rapid decrease there was something wrong.

He asked what was the net effect of such a tariff.

Mr. Long (Norwich) asked what were the conditions under which a Point Five tariff could be adopted; some justification for it was required when coal costs were about id. per unit,

for it was required when coal costs were about \( \frac{1}{2} \)d. per unit, but the financial result was the point to be studied.

Mr. Roles, in a brief reply, expressed his regret that both the authors happened to be working with the rateable value system; the "Point Fives" held that no great progress could be made in cooking supply where gas was cheap unless a charge of \( \frac{1}{2} \)d. per unit or less was made, but he admitted that some load was obtainable at higher prices. He, personally, used 5,000 units a year in his house, and this was an indication of the business they might get later, and were now striving for. He agreed that local conditions must be taken into account, and regretted the sweeping statements made by Mr. Wordingham, which were not borne out by fact. Mr. Wordingham, which were not borne out by fact.

Mr. BLACKMAN added that in his case the effect of the domestic supply on the load was almost negligible.

## The Use of Electric Vehicles in Municipal Service.

The following is an abstract of the report of the Electric Vehicle Committee presented by Mr. F. Ayron, M.I.E.E., Hon. Secretary to the Committee:—

Vehicle Committee presented by Mr. F. Ayron, M.I.E.E., Hon. Secretary to the Committee:—

There could hardly be conceived a more suitable field for the employment of the electric battery vehicle than that connected with municipal service. This is because the work to be done lies entirely within the proper sphere of this particular type of vehicle, viz., short distance haulage at moderate speeds. The mileage capacity per charge, i.e., 35 to 45 for the heavier vehicles, is sufficient for practically every duty which the municipal vehicle has to perform, but it must not be forgotten that, by a mid-day boosting charge, the daily mileage may be considerably increased. In fact, the only limit to the daily mileage is the time required to charge the battery, and, as the modern types of battery allow of the charging being commenced at a comparatively high rate, the time taken, especially for boosting charges, is very materially reduced from the period which used to be considered necessary. As an instance of the amount of work the electric vehicle is capable of performing, the electric street watering and sewer flushing vehicles belonging to the city of Calgary in Canada are reported to be in use for a 16-hour day at certain periods of the year, the superintendent of street cleaning stating that each vehicle had replaced five horse teams with a resultant saving in expense of no inconsiderable amount.

Naturally the main reason for urging the adoption of electric vehicles by municipalities is the degree of economy which attends their use in substitution for horse haulage. Wherever the "electric" has been employed in its legitimate sphere, the claim of economy has been proved to the hilt. In Glasgow the electricity department found that their first electric van, of 1 ton capacity, did the work of two horses at a saving in expense and with greater efficiency, while, compared with a

the electricity department found that their first electric van, of 1 ton capacity, did the work of two horses at a saving in expense and with greater efficiency, while, compared with a petrol van, which the department was previously using, the electric did the same work with a saving in expense in the neighbourhod of £240 per annum. Other evidence is afforded by the refuse collection trials at Barnes and at Heston and Isleworth, referred to in detail later, while the instance of Calgary, previously mentioned, provides an additional illustration of the financial advantages accruing from the employment of this type of road motor, the daily saving, as against tion of the financial advantages accruing from the employment of this type of road motor, the daily saving, as against horses, by the operation of two watering and flushing vans being given as about £5. Outside municipal service we have the case of the electrified delivery service in London of Messrs. Harrod's Stores. This firm now operates no less than 55 delivery vans, and they state to your committee, as their reason for adopting the electric vans: "We find them cheaper than horses."

There is ample evidence, based upon experience, that there is justification for putting the average life of a modern vehicle is justification for putting the average life of a modern vehicle of good make at not less than ten years, assuming reasonable use and proper upkeep. In the United States electric commercial vehicles built twelve years ago are still in daily service and many seen in the streets are well over six years old. A large American firm of goods carriers, having depots and delivery vehicles in all the principal cities, wrote to the committee last year in regard to their experience with electric vehicles, stating, among other things, that "the first cars purchased in 1904 and 1905 are still in daily operation without unreasonable expense or unduly high charges." This company owns no less than 375 "electrics."

Experience has shown that this type of automobile can keep the road day by day for more days in the year than any other type—in fact, records show that it is safe to estimate, in the case of a fleet of electric vehicles, that the average work ing days in a year for each machine will not be less than 97 to 98 per cent. of the maximum possible. The reasons for this are three-fold: first, the simplicity of the mechanism; secondly, the strong construction possible on this account; and, thirdly, the fact that, owing to the simplicity and fewness of the working parts, any repair or replacement can usually be effected during the night, or in such a short time as not to interfere with the use of the vehicle. The net effect of all this is that, where several vehicles are operated, fewer spare ones need be kept than if petrol or steam machines were employed.

A municipality should not lose sight of the influence that the use of any particular type of vehicle may have upon the health of the population and the amenities of the locality; it is the duty of a municipality to set a good example in everything it undertakes. Useful as the horse has been, the principality to set a good example in everything it undertakes. ciples of modern hygiene dictate that its continued use in congested areas is incompatible with the preservation of the best health among the populace and the maintenance of the lowest possible rate of mortality. The place of the horse has, in future, to be filled by the self-propelled vehicle, and the in tuture, to be filled by the self-propelled velucle, and the type which is going to eventually supersede it is that vehicle which will do the same work at the same or lower cost and which, besides, will be characterised by silence in operation, general cleanliness and absence of codour, ease and simplicity of control, rapid acceleration, and safety in regard to the risk of fire. The electric vehicle is the only automobile taking the of fire. The electric vehicle is the only automobile taking the road to-day which meets fully each and every one of these requirements. The modern electric battery vehicle is no mere experiment; its utility and reliability, as well as its unique economy, are attested by the fact that upwards of 70,000 of the type are in use in the United States where, within the last few years, there has been an enormous growth in the numbers put into service. The advantages which the type possesses from the point of view of public health and civic amenities are alone sufficient to warrant its adoption by municipalities. In the case of those municipalities that own electric cipalities. In the case of those municipalities that own electric supply undertakings, there is a further and very pertinent reason why they should set the example as users, and that is the important new source of revenue which the general use of electric vehicles in any district will open up. The value of this additional source of revenue is emphasised by the fact that the demand in connection with it need never come on during "peak-load" hours; hence it may be dealt with with the converge additional avenual arrenditure in plant buildings. out requiring additional expenditure in plant, buildings or mains. Moreover, as its effect will ever be to even out the load curve and so lead to greater economy in the cost of generation, this will, in time, permit of a lower rate being charged to all other classes of consumer.

## THE ELECTRIC SUPPLY DEPARTMENT.

How can any central station hope to induce the adoption of the electric vehicle in its territory unless it first sets the example? A very short experience of the employment of a suitable "electric" for the outside work of an electric supply department of any size will soon make an enthusiast of any engineer. Apart from its splendid advertising value and its usefulness for giving demonstrations, it has many other advantages of special value in this field of employment. For breakdown work it will soon be found invaluable—it is ready to go out at a moment's notice, and is so simple to drive that several of the mains staff may be taught to operate it, in order that there shall always be a driver available. The permanent driver can be a mere youth. There is an advantage in having one who is just old enough to be eligible to hold a licence because that, in itself, attests to the ease of control and the simplicity which is so valuable a feature of the vehicle. There are few, if any, undertakings of reasonable size that could not make use of a 4-ton or 1-ton van for delivering meters, transporting materials to the service and mains-laying gangs, and in other like duties. In the larger undertakings good use may be made of a small electric car for the business rounds of the engineer, the mains superintendent or the sales manager. How can any central station hope to induce the adoption of

of the engineer, the mains superintendent or the business rounds of the engineer, the mains superintendent or the sales manager. Delivery vans are now in use or on order by the Electric Supply Departments of Glasgow, Edinburgh, Derby, West Ham, Croydon, Blackburn, Bootle, Hereford, Ipswich, Grimsby, Brighton, Wolverhampton, Southampton, Liverpool, and the Borough Councils of St. Marylebone, Stepney and

and the Borough Councils of St. Marylebone, Stepney and Poplar.

The van used by the Glasgow Electric Supply Department is a covered one of one-ton capacity, fitted with an Edison battery. The vehicle has been in constant use since August 6th, 1913, and up to April 28th, 1915, had covered a total mileage of 22,284 with an energy consumption of 13,752 units including battery losses, which is equivalent to 0.62 unit per vehicle mile. New tires have recently been fitted in substitution for a set which had done over 11,000 miles.

The results of the use of its one-ton van, in the way of

The results of the use of its one-ton van, in the way of economy and reliability, were so convincing that the department had no hesitation in taking a further step in the general adoption of electric vehicles by placing an order for three more vehicles of half, one and a half, and three tons capacity respectively, which have now been delivered and will shortly be at work. The two lighter vehicles will be used for delivering material from the general store to jobs within the supply area and to the various sub-stations, while the three-tonner will be principally employed on mains work.

The department has fitted up a garage in which these vehicles will be stabled. The garage is complete with charging plant, and having a floor area of 10,400 sq. ft., it will permit of other vehicles being taken in for charging.

The vehicle at Brighton is a two-scater car used by the engineer and manager of the Electric Supply Department for business purposes, including journeys to the power station, a little over four miles outside Brighton. Its speed is about 16 miles per hour on the level; weight, 22½ cwt.; average daily mileage 25, while the energy consumption is about 0.5 unit per mile input to battery. At 1d. per unit this is only about one halfpenny per mile. The vehicle has run close on 1,000 miles at the time of writing, and, so far, beyond the cost of cleaning, it has cost nothing for maintenance, the tires showing little or no signs of wear. The battery is of Tudor make.

The West Ham Electric Supply Department's vehicle has a carrying capacity of one ton, is fitted with a float body, and is used for the general carrying work of the department. It was put into service on November 21st, 1914, and up to March 31st had covered 1,788 miles with a consumption of electric energy of 0.5 to 0.6 unit per mile of input to battery. Here again we have, at 1d. per unit, a power cost of about one halfpenny per mile. The vehicle has proved of the utmost value to the department. The battery is an A6 Edison.

The St. Marylebone Electric Supply Department van is of the covered type employed in the general delivery work of the business. It is fitted with a flart battery. The vehicle weighs

the covered type employed in the general delivery work of the business. It is fitted with a Hart battery. The vehicle weighs 34½ cwt., has a speed of about 13 miles per hour, and consumes 0.61 unit per mile. Up to the beginning of April the total mileage had been about 5,000, while the whole expense of operating it, including driver, sundry repairs, licences, insur-

mileage had been about 5,000, while the whole expense of operating it, including driver, sundry repairs, licences, insurances, etc., amounted to £68.

The vehicle operated by the Electric Supply Department at Wolverhampton is used for delivering goods, such as cookers, heaters and small motors, as well as to take men and the tools on to jobs. The energy consumption is 0.74 units per mile, input to battery, and the speed about 12 miles per hour. The department has on order a 2½-ton vehicle for the removal of clinker and ash from the power station.

The Ipswich vehicle has a total weight of 3½ cwt., a speed on the level of about 12 miles per hour, and an energy input to the battery of about 0.7 unit per mile. A Hart battery is used. The vehicle is used for delivering the goods of the installation department, and is also employed by the mains department. It has proved extremely useful.

The vehicle belonging to the Croydon undertaking is a two-seater run-about fitted with an Edison battery. There is a third seat which may be used if required. The car is used by both the distributing engineer and the sales superintendent, and during the five months in which it has been in use it has given no trouble; the expenditure in repairs and general upkeep has been 2,156, or an average of 24 miles per day. The Borough Electrical Engineer, Mr. A. C. Cramb, gives the following interesting figures as to the cost of operation, the cost of tires being based upon the assumption that an average of 5,000 miles will be obtained before they require renewal, there of tires being based upon the assumption that an average of 5,000 miles will be obtained before they require renewal, there being ample justification for this assumption in view of the very small wear so far observable :-

Running Costs.	Total cost.	Pence ær mile.
Electric energy at 1d. per unit Oil and grease Washing, cleaning, etc Tires (£35 per set for 5,000 miles)	£4 11 8 0 1 5 3 10 0 15 0 0	$0.007 \\ 0.388$
Total running costs		2.565d.
Depreciation.  Battery (5 years)  Vehicle (10 years)	£11 8 4 14 13 4	1.600 1.620
Total fixed charges	•••	3.2204.

Total fixed charges ... ... ... ... ... ... 3.2201.

Total cost per mile = 5.785 pence.

The daily mileage is, of course, somewhat low for such a car, being equivalent to a little over 5,000 miles per annum. A total of 10,000 miles per annum is frequently covered by petrol cars used for "about town" work; on such a mileage the total cost per mile would be reduced to 4.175 pence.

Besides their use for delivering goods, answering "breakdown" calls and carrying the supervising officials about from place to place on the outside work, there are other ways in which the electric vehicle may be made use of in the service of electric supply undertakings. They may be fitted with motor-driven winch gear for use in drawing cable into underground conduits; an electrically-operated pump may be fitted for clearing water from manholes, while a telescopic tower ladder can be provided for trimming are lamps and for overhead work generally. Where a motor winch is provided, the addition of a simple derrick enables the vehicle to be employed in the erection of street lamps and trolley posts.

Where the generating station is not provided with rail or water facilities for the direct delivery of coal, so that the latter has to be certified from the reduced for the generating station is not provided with rail or water facilities for the direct delivery of coal, so that the latter

where the generating station is not provided with rail or water facilities for the direct delivery of coal, so that the latter has to be carted from the railway depot or from a wharf, an electric wagon of suitable capacity should soon pay for itself. The same vehicle could be used for carting away ash and clinker. Considerable use is made of electric vehicles for these purposes in the United States.

In demonstration work convented with the latter of the constration work convented with the latter of the constraints.

In demonstration work connected with the obtaining of new

business, the electric vehicle promises to be a useful aid because of the supply of electric energy which it carries with it. By the aid of a flexible cable carried through the front window of the house, from the vehicle standing outside in the roadway, the canvasser will be able to demonstrate before the housewife at home the transcendent utility of the electric iron, the laboursaving and, no less, the hygienic value of the vacuum cleanor, the comfort and cleanliness of the electric fire, the refreshing breezes of the electric fan, the convenience of the electric kettle and the smaller pieces of cooking apparatus, while last, but not least, he will be able to show that electric light is next in quality to day-light. It needs no stretch of the imagination to conceive how potent a factor in "new business getting" will be such use of the electric vehicle.

#### THE COLLECTION OF HOUSE REFUSE.

The collection of house refuse is work which is particularly trying for the ordinary steam or petrol-motor vehicle, on account of the many stops and starts. The absence of all gearchanging and clutch work in the electric vehicle, and the uniformly easy drive produced by the electric motor, are features which establish a degree of reliability for this type of vehicle in such work, together with an economy in operation, which are impossible of attainment by any other type.

It possesses the advantage also that, when standing, no waste of power is going on such as takes place with the petrol

of power is going on such as takes place with the petrol vehicle, in connection with which it is unreasonable to expect the driver to stop and restart his engine for every short halt.

There is another strong argument in favour of adopting the "electric" when the change is made from horse haulage to motor traction, viz., it is possible, when that type is employed, to utilise the horse-vehicle drivers as the drivers of the new vehicles, because the inchanism is so simple and the operation

Motor vehicles will show the best results where the refuse destructor is at a distance from the area of collection. It is quite possible, on this account, that, in some towns, the best economy might be obtainable by a combination of ordinary horse-drawn vehicles for the districts in propinquity to the destructor, with the use of electric vans for the districts further away. ther away.

ther away.

In a large Continental city the horse carts are provided with removable box bodies, so that when the cart arrives at the depôt, the body is lifted off by an electric crane, and placed upon the flat platform of a large electric vehicle, which, when it has received its full complement of these full boxes, proceeds on its journey to the destructor. In the meanwhile empty box bodies are placed upon the tumbrils, which once more proceed upon their rounds of collection.

An alternative method is the employment for local house-to-

An alternative method is the employment for local house-to-house collection of a special type of small electric vehicle, with tipping-box body. In this machine there is no seat for the driver; the latter stands upon a driving platform a few inches from the ground. The saving of time in getting on and off the vehicle, when compared with the ordinary type of vehicle, in advising

is obvious.

is obvious.

Electric vehicles have been employed to a considerable extent on the Continent for refuse collection. The largest installation is in Paris, where the municipality possesses a fleet of 100 electric refuse-collecting vehicles. Each has a capacity of a little over 15 cubic yards, which, since the local refuse averages some 3 cubic yards to the ton, makes the total load of the full vehicle not less than 5 tons. The vehicles perform their work during the night hours, each covering about 25 miles nightly, with an energy consumption per vehicle mile of from 1.5 to 1.7 units. This system of collection was adopted as the result of a very careful trial made by the civic authorities, which showed that considerable economy would be obtainable by the use of electric vehicles. by the use of electric vehicles.

As the result of a trial of electric vehicles for refuse collection, the Urban District Council of Barnes has placed an order

It was found that one electric van would do the same work per week as that now done by sixteen horses and carts em-

ployed on refuse collection.

The cost of the type of electric van decided upon, complete with battery and electrically driven tipping gear, is £945. The gear takes from 10 to 15 seconds to tip, and the speed of the van on the level is about 10 miles per hour, with a total mileage capacity upon one charge of 40 to 45. The capacity of the van is 41 cubic yards which compares with the 21 varies of van is 41 cubic yards, which compares with the 21 yards of the present cart.

As a result of careful tests, the Surveyor, Mr. Tomes, found that the cost of operation came out at 19s. 4d. per van per day, which figure covered interest upon cost of vehicle, as well as its share of the charging equipment, repayment of loan on both of these items, wages, electricity, tires, maintenance of battery and chassis, insurance, lubricants, and sundries. The comparable figure for a horse and cart is 11s. per day.

Basing his estimate upon the figures obtained by the trial of the electric vehicles. Mr. Tomes reported to his Council that the replacing of the existing horses and carts by four electric vans would, notwithstanding a capital expenditure of £4,000 on the vans and charging plant, result in a saving of at least £400 per annum.

A similar trial, made by the surveyor of the Heston and Isleworth Urban District Council, resulted in the Council placing an order for an Edison electric dust van. The trial was specially interesting from the fact that experiments were made with three types of automobile (namely, electric, steam,

and petrol) in order to determine the one best suited for this work. The electric van's safe load was 2.68 tons; it had a motor tipping body, and was fitted with Edison accumulators. The Garrett steam wagon had a capacity of 3 tons, and the Thornycroft petrol wagon could carry 3.2 tons. It was found that any one of the three motor wagons could do the same work as previously done by four of the Council's horses, but in point of saving in cost over horse haulage, the electric vehicle showed £71, the steam wagon £66, and the petrol wagon only 7s. 7d. per annum. The report of the Works Committee to the Council concludes by stating:—"After careful consideration of the whole matter, the Committee have come to the conclusion that an electrically propelled vehicle would be the best and most suitable for the purposes of house refuse collection." It is interesting to note that the purchase costs of the three types of vehicles were: electric, £840; steam, £617; and petrol, £815; the estimated annual costs of working, including capital charges, being given as £333, £338, and £404 respectively. While the results in working cost for the steam wagon are a near approach to those of the electric, the surveyor notes that the "driver of the electric vehicle does not need any mechanical knowledge, an ordinary intelligent carter being quite able to perform the duties of driver"; while, in regard to the steam wagon, he remarks: "As is well known, a good driver is not always obtainable, and can only be discovered by the experience gained by the cost of repairs."

In December of last year some interesting trials were made of the use of electric vehicles for the collection of house refuse in Birmingham. As a result the Birmingham Corporation have placed an order for two "Orwell" electric refuse-collection vans. and petrol) in order to determine the one best suited for this work. The electric van's safe load was 2.68 tons; it had a

Dover is another place where electric vehicles are about to be used for the collection of house refuse, the Corporation having, as the result of a trial of an Edison vehicle of two tons capacity, decided to order six such vehicles. Each will take the place of three carts and sixteen horses. A considerable annual saving is anticipated by the change in system.

## (To be continued.)

#### · DISCUSSION.

The discussion was opened by Mr. LACKIE (Glasgow), who The discussion was opened by Mr. LACKIE (Glasgow), who agreed as to the necessity of interesting the various corporation departments in the electric vehicle. His own department used an electric truck for cable work; it was fitted with a motor generator, by which the cables could be tested before they were connected up. In Glasgow a hired horse and cart cost three or four shillings a day more than formerly and doing the work of two carts the electric hired horse and cart cost three or four shillings a day more than formerly, and doing the work of two carts the electric showed a clear saving of £80 a year. A yearly revenue of £20 from the ½-ton and £40 from the 1-ton vehicle (at 1d. per unit) could be obtained. The one drawback to the electric was its first cost, but this would be rectified later; he thought something should be done to standardise the tare weights of such vehicles.

something should be done to standardise the tare weights of such vehicles.

Mr. C. H. Wordingham asked whether it was likely that the electric vehicle on ordinary roads was likely to succeed when the numerous attempts to run battery-driven tramway cars, which operated under ideal road conditions, had been unsuccessful? He agreed that the "electric" was a good

successful? He agreed that the "electric" was a good advertisement.

Mr. R. A. Chattock said he had come to the conclusion that the electric truck was the thing for industrial work in cities, and the present-day vehicle was an advance on those shown two years ago at Kingston-on-Thames. It was a mistake to think of the electric in comparison with the petrod vehicle. What was wanted now was a light "runabout" passenger car, and if the makers could be induced to turn out such a car at a cheap price, it would supply a want, but it must be light and cheap. Most of the American cars were too big and heavy. It was not fair to make comparisons between trolley and battery-driven cars, and there were some 70,000 electric vehicles in use in the States, where tramway cars were also numerous. He concluded by expressing satisfaction at the progress of standardisation in connection with vehicle at the progress of standardisation in connection with vehicle

Mr. BEAUCHAMP (West Ham) said he found that the electric

mr. Beauchamp (West Ham) said he found that the electric truck could haul cable quite well and cheaply. His own department had a vehicle which ran about the area, averaging 174 miles a day at a cost of 7d. a mile; the actual running time was only 24 hours daily.

Mr. Bruce Tomes (Barnes) referred to the satisfactory trials made in his area with an electric dust van, a full report of which appeared in the Electrical Review.

Mr. Ellis (South Shields) said that the two Edison 'buses operated by the South Shields Corporation gave every satisfaction on country roads. The batteries were charged at the car shed between 11 p.m. and 6 a.m. at a cost of \$\frac{3}{4}d\$, per unit, and a boost was given at the end of each journey at a small charging station. The cost of the "electric" was a serious matter; inquiries for a 3-ton vehicle showed the Edison truck cost \$1,100; the Baker truck £700, while a petrol truck cost about £600 and was a speedier vehicle. Many people wanted speed, and he thought the battery capacity could be increased to provide for this. The electric dust van was preferable to others on account of the numerous stops.

Mr. Hame (York) said his Corporation had four Edison 'buses which had run 13,600 miles, with an overall energy consumption of 1.1 units a mile. Petrol would have cost them

£500 a year, but electricity at 11d. per unit was costing only £365, showing a saving to the town and providing a consumer of electricity. The 'buses were very satisfactory on level roads.

Other speakers suggested that the design of refuse vans would be improved by making them lower, to avoid climbing up; also that a battery driven road roller was an ideal vehicle for corporation use; and that the Electric Vehicle Committee should confer with the vehicle makers in order to get suitable vehicles made.

Mr. H. Webber (Keighley) referred to the improved results obtained in his area by substituting the trolley 'bus for the petrol 'bus. The former cost about 7d. a 'bus mile, including

petrol 'bus. The former cost about 13. — capital charges to run.

Mr. Brydges (Eastbourne) also took up the question of petrol 'buses which in his town cost 11d. per 'bus mile, all in. They had obtained a £550 4½-ton steam wagon for carrying coal to the generating station; the round trip was 2½ miles, and 6 loads a day were carried, with 3 men to operate the truck and load. The cost per ton delivered at the works was achieved it formerly cost is 6d. a ton by contract with truck and load. The cost per ton delivered at the works was truck and load. The cost per ton delivered at the works was 11.1d., whereas it formerly cost 1s. 6d. a ton by contract with horse haulage. If the electric truck could do as well as this, he would be glad to consider it, because it would be a

Mr. Christie (Brighton) said station engineers should practice what they preached. He had a "home made" vehicle which he found very useful for "running round the town," and which attracted a great deal of attention. An electric and which attracted a great deal of attention.

which he found very useful for "running round the town, and which attracted a great deal of attention. An electric delivery van had proved quite capable of negotiating the hilly roads in Brighton. To provide for vehicle charging they had reconstructed part of the old station and would be able to accommodate 12 vehicles; they also expected to hire out charging equipments.

Mr. Shaw (Ilford) said he had investigated the electric truck for coal haulage, and taking a 4½ ton vehicle, he expected to save from £120 to £160 a year on horse haulage at 10d. a ton. The truck in question was an Edison vehicle costing £440. The accumulator tower wagon, used on the Ilford transways for 18 months, had given every satisfaction.

Mr. Warson (Edison Co.) said the reason why the electric vehicle was cheaper to run than other types was because they did not attempt to run it above the suitable speed; other vehicles often had high speed qualities which were rarely used. It was a mistake to suppose that first cost was everything, and it was interesting to note that the Midland Railway Co., after trying platform trucks, was now buying 20 electric vehicles, which was a good sign. In the case of a well-known firm of distillers, the bill for energy for their electric truck, for seven weeks, was so low that it was returned under the impression that a mistake had been made. He felt certain that

firm of distillers, the bill for energy for their electric truck, for seven weeks, was so low that it was returned under the impression that a mistake had been made. He felt certain that the electric vehicle would practically monopolise refuse collection in a few years' time.

Mr. Wyld (Hampstead) said they had tested an electric van for two weeks and found the cost not more than two-thirds of the horse vehicle. The Works Committee, however, could not see its way to pay £1,000 for the vehicle, and so the Lighting Committee had offered to purchase it and hire it to the former, with driver's and all service charges included, for a period of four years.

Mr. Meakin (Wolseley Motors) said engineers were too keen on speed; the electric had no chance against the petrol vehicle in the matter of speed, but it was the machine for short hauls and many stops. Speed was everything to the

vehicle in the matter of speed, but it was the machine for short hauls and many stops. Speed was everything to the petrol car and against the electric, which would depreciate rapidly under such conditions. The electric coupé was quite good for city work. He agreed that the price of the "electric" was much too heavy; his own firm made both types and put much more work into the petrol car for less money. It must be remembered, too, that the electric car could not meet both conditions of speed and short hauls, while the petrol car could.

conditions of speed and short nauls, while the petrol car could.

Mr. F. Ayron (Ipswich), in reply, agreed that each type of vehicle had its own field of use. All would agree that prices would have to come down, but business could be obtained at present prices. If the demand were increased, the price would drop. He thought a front wheel drive vehicle for refuse collection, with a low body, was now on the market. Comparison with rail vehicles or trolley 'buses, did not take into account the mobility of the electric vehicle.

## TRADE WITH ITALY.

## [ITALIAN CRITICISM OF BRITISH TRADEES.]

The May issue of the Bulletin of the British Chamber of Commerce for Italy (Inc.), which has just come to hand, contains a good deal of matter of great interest, expressing the urgent desire of our latest Ally that England shall do more to enable Italy to free herself from German commercial domination. The correspondence received by the Bulletin consequent upon the publication of an article in its March number, includes a letter from a firm of Birmingham exporters in which he says that credit is the crux of the whole question of trade with Italy. The German export trade, he says, has ruined many markets by long credits; the usual credit The May issue of the Bulletin of the British Chamber of

terms in Italy run from anything between three and six months, and with small firms the risk is then bound to be great. Bad debts are considered the chief danger of the market, partly due to the smallness of the trade, and partly to the character of the Italian buyers. The writer considers that in this respect business relations can more easily be improved from the Italian end than from the English. The Italian bankruptcy laws also give very little protection to foreign creditors "and are, practically speaking, a premium on dishonesty." The writer goes on to say that such remarks do not of course apply to the many very fine firms with whom anyone would be only too anxious to do business. If German firms were at that time continuing on the same lines as before it was because Germany found it absolutely vital to hang on to any market that she had got, whereas England was free to devote her attention to other markets. Since the letter was written Italy has entered the war and England is increasingly busy making war munitions. The writer says that his remarks apply to hardware trade pure and simple. In the heavier trades such as metals, chemicals, etc., things are much better, and in these he finds Italy to be an excellent market—long credits are not asked for, the business is done usually for cash against documents, and the class of customer is much superior.

Another correspondent. "A British Merchant at Genoa." is much superior.

Another correspondent, "A British Merchant at Genoa,"

says:—

"Britishers in Italy had preached to them the 'Trade War on Germany'; it was to be a crusade, and the duty of every patriotic Englishman was to supplant German goods in Italy by British-made goods. We were all fired with enthusiasm: a crusade which incidentally would also improve our incomes was evidently attractive. After nine months' war, however, the 'Crusaders' are much discouraged: German goods continue to arrive and are sold on the old terms: British makers are either too busy with orders for France and Russia, or their works are devoted to war-material, or they will 'think it over when Italy has joined the Allies.' It would therefore appear to me that the Trade War on Germany in Italy does not interest British manufacturers, and if this is so, the matter had better be dropped."

"As regards the past, you cannot get over the hard fact that

As regards the past, you cannot get over the hard fact that in 1913 Germany imported into Italy goods to the value of 23 millions sterling and Great Britain only 10 millions, excluding coal in each case. If British manufacturers and shippers do want Italian custom, let them conform to the wing hints; but if they do not want the trade, then let

us stop this absurd preaching:

1. Adopt metric system of weights and measures for all quotations to Italy.

2. Quote in francs gold. I agree that they cannot be expected to do so in lires. 3. Send out active travellers who can at least speak good French; they would, of course, do much better if they knew Conduct correspondence in Italian, or at any rate

in French.

4. One can generally give three months' credit if an accepted 4. One can generally give three months' credit if an accepted bill is obtainable against delivery of the goods. The law amply protects the holder of an accepted bill; if it is not met at maturity, the bailiffs can be put in at once, but of course ones client must be reasonably sound: a rogue is a rogue in all countries and not a monopoly of Italy."

The writer proceeds to give an instance from personal knowledge of the obstinacy of British firms. "The goods they supply are excellent; this for them is sufficient; they decline to alter their methods of delivery or make-up to suit this market."

An "Italian Agent at Naples" wrote to a number of British firms whose names had been provided by the Chamber, on

An "Italian Agent at Naples" wrote to a number of British firms whose names had been provided by the Chamber, on the advisability of introducing British goods in Italy, and he reports: "The result of my correspondence was very discouraging. Three-fourths of the firms . . . . failed to reply, which only on very rare occasions has ever happened to me in all my commercial career when French of German firms were concerned. The other firms agreed to appoint me their representative, but as a buying agent, . . . , this method of agency is practically unknown in Italy, where the agent is the connecting link between the manufacturer and the conthe connecting link between the manufacturer and the consumer. The failure of my negotiations has greatly pained me, because, apart from commercial relations, I have always fall ment attacks and Fagland. me, because, apart from commercial relations, I have always felt great sympathy for France and England. . . . Can one succeed with such methods to destroy German export trade into Italy? I leave you to decide."

The Bulletin gives a précis of articles appearing in the Italian press. The criticism is so strong that we think it only right that Britisherrs should be able to read it in our pages precededly in full.

practically in full:-

Our market offers especially an excellent opening for manuour market offers especially an excellent opening for manufactured goods, which only two countries would be able to supply: Great Britain and Germany. It was therefore clear that, there being obstacles in the latter's way, sales would be easier for the former. German penetration in Italy represents still a masterpiece of ability and patience. The Germans endeavoured to adapt their goods to the needs of the market, and their properties of the market, and their properties of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of the market of endeavoured to adapt their goods to the needs of the market, and also their prices and terms; they used more especially the efficacious arm of cheapness, to which they united the not less efficacious one of methods of payment, not only for the articles of direct consumption, but also in the larger field of instruments of production. Our manufacturers desirous of widening out or perfecting their plant, found in the Germans not only unusual credit terms, but also practical assistance

in the mounting and working of machinery. The German staffs, and Italian staffs in the service of the Germans, insinuated themselves everywhere, assuming leading positions and managing some of the individual works. They even sought to prevent the establishment of certain factories which would have clashed with those in Germany, sooner or later, seeking to induce the Italian works to turn out inferior articles in order to allow of German competition. Germany was already reaping the fruits of her methods; in 1895 she held a modest position among the nations exporting to Italy, whilst in 1913, one year before the war, she had attained absolute pre-eminence with 603 millions of lires' worth of goods sold, leaving behind England with a total of only 591 millions. On the outbreak of war, British merchants at once thought of reconquering the neutral markets and the Board of Trade called attention to Italy, where Germany's hold seemed to be relaxing. The incitement came at the right moment, but will British manufacturers and merchants know how to take advantage of this favourable opportunity? Their attempts so far have not been very successful because they have not been able to get over their spirit of conservatism which leads them to impose their commercial customs which it is difficult to reconcile with the exigencies of the foreign markets in which they wish to operate. Our fellow-countrymen who have sought to get into touch with British producers have found themselves confronted by two obstacles, almost insurmountable, especially at the present moment. Such obstacles are the high prices and the terms of payment. For certain machines produced in Italy at 100 lires, for instance, Germany does not hesitate to quote the same price, while British firms will ask about 250 lires. Such enormous differences exist for hundreds of articles in which the superiority of quality does not always justify the highness of the price. The Germans pearly always allow a certain amount of credit, long or short, while British firms ask for like the Italian buyers to deposit a large sum at a bank in England, to be drawn on against presentation of the documents. This is therefore payment in advance, a thing quite impossible for a country like ours, in which, for certain goods, even the payment on delivery of the goods appears impracticable. It is certainly not with similar systems that the British will be able to get a footing where the Germans were operating with undeniable sucess. Great Britain should adapt herself to the requirements and needs of our market, applying thereto the methods employed by the Germans. We do not thereby wish to deprecate in general the British way of doing herself to the requirements and needs of our market, applying thereto the methods employed by the Germans. We do not thereby wish to deprecate in general the British way of doing business, but only to point out that such system, excellent perhaps in other times and other countries, does not adapt itself to our case; and as commercial exchanges are the fruit of two wills, i.e., of the seller and of the buyer, one must therefore take due account of ours when placing foreign products in Italy. We wished to say this in our own interest and in that of England. It is of interest to Italy to have another market to provide her with goods, and it is also of interest to Great Britain not to lose more ground to German connectition, which—it is useless to delude oneself—will get competition, which—it is useless to delude oneself—will get to work again, and with renewed energy as soon as the war

competition, which—it is useless to delude oneself—will get to work again, and with renewed energy as soon as the war is finished.

"Italy needs to slacken, if it is not possible to cast them off entirely, the bends which hitherto have bound her to Germany, and which, if the war had not supervened, would in the end have suffocated her. Now we have commenced to breathe again, and we now need to substitute, as far as possible, connections which will be done away with or diminished. And this, in a large measure, will have to be done with England, who, on her part, will have every inducement to turn towards Italy part of her great energies. Italy is better prepared for the change than England; we have already connections and sympathies for Great Britain, and the English we willingly state are much more popular and better liked in Italy than Germans have been or ever will be. For many years, almost the only article imported from Great Britain that has shown an important increase is coal, indispensable for our industries; whilst Germany prevailed and imposed herself. Britishers must make a radical change if they want to go ahead in Italy. Germany had conquered Italy commercially not only by money and facilities, but especially by men, whom she has spread broadcast, in the banks, factories, commercial houses, and in the very life of the country. Whilst the English form in Italy a notable, beneficent and well-liked colony of a few workers, and a good number of gentle-folks who enjoy in peace our sky and natural beauties, the German colony is far more numerous and not a single individual composing it is extraneous to the action of conquest; they all co-operate like a disciplined army in the work of infiltration. England, therefore, if she wishes to reduce the competition, should send us men, men, and more men, to carry out, openly and sincerely, a whole programme of commercial penetration. Some of the chief obstacles to overcome are the following, viz.: The system of weights and measures used in England, which should be

and then it would be possible to foster British trade in Italy; without such a financial organisation, which should be really commercial and look after Anglo-Italian trade, progress will be very difficult, if not impossible, and a start should be made at once, not at the end of the war when German competition will again be rife."

The following figures show some of the imports of Italy from Germany and Austria-Hungary during the year 1014.

8.712. "Telegraph systems and apparatus therefor," British Insulated and Heisby Cables, Ltd., & H. Harrison. June 12th. (Complete.)

8.713. "Thermo-electric pyrometers." H. G. C. Farkweather, June 12th, (Deutsche Gasgluhlicht Akt, Ges. Auer., Ges., Germany.) (Complete.)

8.717. "Sparkiag plugs." V. John. June 12th. (Convention date, June 13th, 1914, Belgium.) (Complete.)

#### PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of MESSRS. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

#### 1914

9.822. AUTOMATIC TELEPHONE SYSTEMS. Akticselskabet Elektrisk Bureau. April 21st. (April 22nd, 1913.)
12.364. Receivers for Wireless Telegraphy and Telephony for Diminishio. of Atmospheric Influences on such Receivers, P. O. Pedetsen. May 19th. 12.720. Light, High-power Electric Accumulator. Marquise des Ligheris. May 23rd.

12.867. ELECTRICAL RESISTANCES. C. O. Bastian. May 25th. (Cognate application, 22,872/14.)

12,926. MERCURY MOTOR METERS. W. Hamilton & Ferranti, Ltd. May 26th. 13,147. SERIES PARALLEL CONTROL SYSTEMS FOR ELECTRIC MOTORS. British Thomson-Houston Co. (General Electric Co.). May 28th.

Thomson-Houstot Co. (General Electric Co.), May 28th.

13.159. Dynamo-electric Machines. Compagnic de l'Industrie Electrique et Mecanique. May 28th. (May 30th. 1913.)

13.247. Vaccous Tubes used as Machiners and Producers of Continuous Electrical Oscillations. Marconi's Wireless Telegraph Co. & H. J. Round. May 29th.

13.248. Production of Continuous Electrical Oscillations and the utilisation thereof for Wireless Telegraph and Telephony. Marconi's Wireless Telegraph Co. & H. J. Round. May 29th.

13.362. Telephone Exchanges. C. A. W. Hultzman. May 30th. (June 2nd. 1913.)

20.156. Sparking-plans for Instruments of The Moving Coll Type.

14.557. Electrical Measuring Instruments of the Moving Coll Type.

T. W. Brogger. June 17th.

15.062. Medianical Selector for Electro-magnetic Wayfs applicable to Wireless Telegraphic Rechving Apparatus. R. B. Goldschmidt. June 23rd. (May 2nd. 1914. Addition to 14.595/14.)

16.130. Automatic Electric Switching Mechanism for Controlling Fluid Compressions. O. H. Pieper & A. F. Pieper. July 6th. (February 7th, 1914.)

17.686. Compound for making Water-tight the Joints of Covers of Boxes for Underground Electric Mains and Distributions, and Similar Joints of Boxes fixed in Exposed Positions. W. H. Walker. July 27th.

18.713. Electric Batteries. G. Fuller, G. J. A. Fuller, & L. Fuller. August 15th.

20.156. SPARKING-PLUGS FOR INTERNAL-COMBUSTION ENGINES AND THE LIKE. T. McClements. September 25th.
21.538. Printing Telegraphs. C. J. Wiley. October 26th.
22.879. Apparatus for Directed Wireless Telegraphy and Telephony. F. Bellini. November 21st. (June 24th, 1914.)
23,359. Electric Reactance Coils. J. F. Peters. December 1st. (February 5th, 1914.)

1,328. ELECTRIC SWITCHES. H. Lucas & D. H. Edwards. January 27th.

1,328. ELECTRIC SWITCHES. H. Lucas & D. H. Edwards. January 27th. 1,870. VAPOUR ELECTRIC RECTIFIER SYSTEMS. S. W. Farnsworth. February 5th. (February 5th. 1914.)

2,728. ELECTRIC SMELTING FURNACES AND THE LIKE. F. W. Highfield. February 19th. (Divided application on 4,937/14, February 25th.)

6,476. CATHODES OF VACCOUS TUBES SUTFABLE FOR USE IN WIRELESS TILE-GRAPHY. Marconi's Wireless Telegraph Co. & H. J. Round. April 30th. (Divided application on 13,247/14, May 29th.)

Copper.—Mid-monthly returns for June, as set forth in Messrs, H. R. Merton & Co.'s statistical circular, show a further increase in European visible supplies of 1,257 tons, and in English supplies of 2,792 tons. European arrivals from North America are low; from Spain and Portugal to England and France the quantity for the fortnight is considerably in excess of the pre-war average for a month. Other countries (not classified) have supplied England and France with 3,396 tons in the fortnight, a quantity arly equal to one month's average supply before the wa shipments are below the pre-war average, and Australian the same. Total deliveries are lower, denoting a total for the month about equal to last February, though this may, of course, be increased during the present fortnight.

Municipalities and the Purchase of Tramway Undertakings.—In the House of Commons, Mr. Snowden asked the Prime Minister if he would take steps to relieve municipalities from the position in which some of them had been placed by the from the position in which some of them had been placed by the restriction of borrowing powers in the following circumstances:—Some municipalities have the option this year of purchasing the local tramway system, the Corporation of Bristol being a case in point; but owing to the refusal of the Treasury to grant public loans, it is impossible to exercise this legal option, with the result that the private tramway company will be reinstated for a long term of years, and the public rights will thus be rendered invalid, and that the loss of the power to exercise the option of purchase will, in the case of Bristol, involve a loss of £20,000 a year for seven years, as well as the advantages of public ownership, and also heavier cost if purchase should be exercised at the expiry of the extended lease. Mr. Snowden asked if the Government would consider the desirability of special legislation entitling the municipalities to exercise the right of purchase now, but to postpone the re-issuing exercise the right of purchase now, but to postpone the re-issuing of the loan to, say, six to twelve months after the end of the war. Mr. Asquith said he understood that an application from the Corporation of Bristol had been received by the Treasury relative to the question of the purchase by the Corporation of the local tramway system, and that this application had been referred to the Committee on Fresh Issues of Capital. Pending the received their report it was preparative to consider in this restriction and their report, it was premature to consider in this particular case what step, if any, should be taken in the contingency to which the hon, member referred. The general question raised, he thought, was best dealt with in relation to specific cases as they arose.
